## Key indicators

Single-crystal X-ray study  
T = 95 K  
Mean  $\sigma(\text{C}-\text{C}) = 0.007 \text{ \AA}$   
R factor = 0.042  
wR factor = 0.092  
Data-to-parameter ratio = 19.2For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

The title compound,  $\text{C}_{13}\text{H}_{10}\text{Br}_2\text{O}_2$ , was obtained during the synthesis of azulene derivatives. There are two independent molecules in the asymmetric unit. The azulene frameworks of the molecules are planar, with mean deviations of 0.01 and 0.02 Å from the ring planes.

## Comment

A number of azulene derivatives are known with varying substitution patterns (Nefedov, 1973). We were more interested in synthesizing 2,6-disubstituted azulenes and perhydroazulenes, as the latter framework is a part of many natural products and is expected to be a potentially photochromic compound (Daub *et al.*, 1990). However, it is surprising that the crystal structures of only a few azulenes and their derivatives are known (Kaftory *et al.*, 1997). It is also worth noting that the substitution pattern of azulene and perhydroazulene derivatives plays an important role in determining the properties described above, and specific substitution at the 2- and 6-positions, which gives linear derivatives, was most important for our studies. We were able to obtain this pattern in many of our new derivatives with excellent overall yield. Compound (I) was formed as an unexpected product in 5–10% yield during the synthesis of 2,6-disubstituted perhydroazulene derivatives. Although (I) was obtained as a by-product in a very low yield, it was possible to increase the yield by prolonging the reaction time.

- (I) X = Y = Br, Z = -COOEt  
 (II) X = Y = Br, Z = H  
 (III) X = Y = Cl, Z = H  
 (IV) X = Y = I, Z = <sup>t</sup>butyl  
 (V) X = Y = F, Z = isopropyl  
 (VI) X = Y = NO<sub>2</sub>, Z = H

Comparison of (I) with known compounds such as (II)–(VI) reveals its importance for functional group interconversion at the 6-position, which is not easy in (IV) (Fabian *et al.*, 2000) and (V) (Tetreault *et al.*, 1999) and perhaps very difficult in (II) (Anderson *et al.*, 1957), (III) (Nefedov, 1973) and (VI) (Anderson *et al.*, 1964). Compound (I) can be used for a

number of 2,6-disubstituted derivatives to study structure–property relationships.

There are two independent molecules (*A* and *B*) in the asymmetric unit. Fig. 1 shows molecule *A*. The azulene framework is planar, with a mean deviation of 0.01 and 0.02 Å for *A* and *B*, respectively, from the ring planes. The plane defined by all non-H atoms of the ethyl ester group is inclined from the ring plane of the azulene framework by 4.3 (4) and 3.3 (4)° in *A* and *B*. The bond lengths of the ten-membered ring systems, in the range 1.374 (8)–1.413 (7) Å (Table 1), do not show significant differences in molecules *A* and *B*. This is similar to what is observed in other substituted azulene derivatives (Kaftory *et al.*, 1997). Only the bonds between the bridgehead atoms of (I) are considerably longer [1.507 (6) Å and 1.495 (7) Å in molecules *A* and *B*, respectively].

## Experimental

2-(*tert*-Butyl-diphenylsilyloxy)-4,4a,5,5a,6-pentahydrocyclopropa-[f]indan-5-carboxylic acid ethyl ester (6.0 g, 13.39 mmol) was dissolved in CCl<sub>4</sub> (300 ml) with stirring and cooled in an ice bath. Bromine (2.139 g, 13.39 mmol) dissolved in CCl<sub>4</sub> (20 ml) was added dropwise with stirring. When the addition was complete, triethylamine (6.62 g, 65.64 mmol) was added. Triethylamine hydrobromide began to form immediately. The mixture was refluxed for 18 h. The HBr salt was filtered off and the filtrate was evaporated. The resulting oil was washed with water, dried over MgSO<sub>4</sub> and filtered to yield the crude product. The mixture containing the 2,6-azulene derivative and (I) was purified through a column of silica gel using pentane as an eluant by increasing polarity with dichloromethane (1–10%). Compound (I), being less polar, eluted first (dark blue), followed by the 2,6-azulene derivative, and was recrystallized from dichloromethane and hexane to yield dark green needles.
