## Key indicators

Single-crystal X-ray study
$T=173 \mathrm{~K}$
Mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$
Some non-H atoms missing
Disorder in solvent or counterion
$R$ factor $=0.030$
$w R$ factor $=0.085$
Data-to-parameter ratio $=14.5$

For details of how these key indicators were automatically derived from the article, see http://journals.iucr.org/e.

[^0]
## Dichlorobis[2-(3,5-dimethylpyrazolyl-1-carbonyl)furan]palladium(II) bis[aquatris(pentafluorophenyl)boron] dihydrate dichloromethane disolvate

Reaction of the Pd complex [( $3,5-\mathrm{Me}_{2} \mathrm{pz}-\mathrm{CO}$-furan $)_{2} \mathrm{PdCl}_{2}$ ] (where pzH is pyrazole) and the Lewis acid $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}$ in the presence of adventitious water resulted in the formation of the title compound, $\left[\mathrm{PdCl}_{2}\left(\mathrm{C}_{10} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{O}_{2}\right)_{2}\right] \cdot 2 \mathrm{C}_{18} \mathrm{HBF}_{15} \mathrm{O}_{2}$.$2 \mathrm{H}_{2} \mathrm{O} \cdot 2 \mathrm{CH}_{2} \mathrm{Cl}_{2}$, in $60 \%$ yield. The Pd complex occupies a crystallographic inversion center and exhibits a square-planar geometry. The two proposed dichloromethane molecules in the formula are highly disordered.

## Comment

Late transition metal olefin oligomerization and polymerization catalysts have recently attracted significant attention, since Brookhart et al. (1995) discovered that the electrophilicity of metal centers plays a significant role in their catalytic activity and that cationic $\alpha$-diimine $\mathrm{Ni}^{\mathrm{II}}$ and $\mathrm{Pd}^{\mathrm{II}}$ catalysts facilitate olefin coordination prior to their insertion and subsequent chain growth. Results reported by Bazan and co-workers (Komon et al., 2000a,b, 2003; Lee et al., 2001) demonstrated the impact of carbonyl coordination to borane in either $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}$ or $\mathrm{BF}_{3}$ on the catalytic activity of the Shell higher olefin process type catalysts, such as $\left[\left(\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2} \mathrm{PC}_{6} \mathrm{H}_{4}-\right.$ $\mathrm{C}(\mathrm{O}) \mathrm{O}-\kappa P, O] \mathrm{Ni}\left(\nu-\mathrm{CH}_{2} \mathrm{CMeCH}_{2}\right)$ (Keim, 1990).

(I)

As part of our investigation of pyrazolyl (pz)-palladium(II) complexes as olefin oligomerization and polymerization catalysts (Guzei et al., 2003, Ojwach et al., 2005), we attempted to improve the ethylene polymerization activity of the dichlorobis[2-(3,5-dimethylpyrazolyl-1-carbonyl)furan]palladium(II) complex by forming a borane adduct of this complex with $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}$, in which the carbonyl O atom binds to the B atom of $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}$.

Unexpectedly, the title compound, (I) was isolated, a result that emphasizes the need for absolutely dry synthesis conditions. The Pd complex in (I) (Fig. 1) occupies a crystallographic inversion center and exhibits a square-planar geometry. The most interesting geometrical feature is the displacement of the Pd atom from the plane of the pyrazole ring by 0.697 (3) $\AA$. Thus, the lone pair of electrons of atom N 1 of the pz ligand donates electrons to the Pd atom at

approximately a $20^{\circ}$ angle rather than linearly. The $\mathrm{Pd}-\mathrm{Cl}$ bond in (I) [2.3014 (5) Å; Table 1] is somewhat shorter than the average of 2.33 (4) A calculated for $2151 \mathrm{Pd}-\mathrm{Cl}$ distances in 1306 complexes reported to the Cambridge Structural Database (CSD; Version 5.26, updated May 2005; Allen, 2002). The $\mathrm{Pd}-\mathrm{Cl}$ distances in these 1252 complexes span the range $2.222-2.516 \AA$; therefore, the $\mathrm{Pd}-\mathrm{Cl}$ separation in (I) is within the expected range. The $\mathrm{Pd}-\mathrm{N}$ bond length in (I) [2.0225 (15) $\AA$ ] agrees well with the average bond length of 2.03 (4) $\AA$ calculated for $214 \mathrm{Pd}-\mathrm{N}_{\mathrm{pz}}$ bond lengths in 88 complexes reported to the CSD, and falls in the middle of the range for this type of bond $(1.928-2.189 \AA)$. The $B$ atom of the tris(pentafluorophenyl)borane-water adduct exhibits a tetrahedral geometry. The $\mathrm{B}-\mathrm{C}$ bond lengths are normal and the $\mathrm{B}-\mathrm{OH}_{2}$ length of 1.576 (2) $\AA$ agrees well with the average of the eight such compounds reported in the CSD [1.57 (3) A]. Usually, the $\mathrm{B}-\mathrm{OH}$ and $\mathrm{B}-\mathrm{OR}$ lengths are shorter and the presence of a water molecule rather than a hydroxy group is chemically reasonable. There are hydrogen-bonding interactions between the borane-water adduct and the uncoordinated water molecules (Fig. 2 and Table 2).

## Experimental

To a solution of $\operatorname{Pd}\left(3,5-\mathrm{Me}_{2} \mathrm{Pz} \text {-CO-furan }\right)_{2} \mathrm{Cl}_{2}(0.12 \mathrm{~g}, 0.22 \mathrm{mmol})$ in cold toluene ( $20 \mathrm{ml}, 273 \mathrm{~K}$ ) was added $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}(0.12 \mathrm{~g}, 0.22 \mathrm{mmol})$. The mixture was stirred for 2 h to give an orange precipitate. After the reaction period, the mixture was filtered and the residue recrystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$-hexane at 269 K to give single crystals of (I) suitable for single-crystal X-ray analysis. Yield $0.21 \mathrm{~g}, 60 \%$. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 2.24\left(s, 6 \mathrm{H}, \mathrm{CH}_{3}, \mathrm{pz}\right), 2.54\left(s, 6 \mathrm{H}, \mathrm{CH}_{3}, \mathrm{pz}\right), 6.09(s, 1 \mathrm{H}, \mathrm{pz})$, $6.79\left(d d, 2 \mathrm{H}\right.$, furan, $\left.{ }^{3} J_{\mathrm{HH}}=3.8 \mathrm{~Hz},{ }^{4} J_{\mathrm{HH}}=1.8 \mathrm{~Hz}\right), 7.60(d d, 2 \mathrm{H}$, furan, $\left.{ }^{3} J_{\mathrm{HH}}=3.8 \mathrm{~Hz},{ }^{4} J_{\mathrm{HH}}=1.6 \mathrm{~Hz}\right), 7.88\left(d d, 1 \mathrm{H}\right.$, furan, ${ }^{3} J_{\mathrm{HH}}=3.8 \mathrm{~Hz}$, ${ }^{4} J_{\mathrm{HH}}=1.6 \mathrm{~Hz}$ ); IR (Nujol): $v(\mathrm{C}=\mathrm{O})$ 1694. Analysis calculated for $\mathrm{C}_{56} \mathrm{H}_{24} \mathrm{~B}_{2} \mathrm{Cl}_{2} \mathrm{~F}_{30} \mathrm{~N}_{4} \mathrm{O}_{6} \mathrm{Pd} \cdot 2 \mathrm{H}_{2} \mathrm{O} \cdot \mathrm{CH}_{2} \mathrm{Cl}_{2}$ : C 38.20, H 1.77, N 3.07; found: C $39.75, \mathrm{H} 1.52, \mathrm{~N} 4.00 \%$.

Symmetry codes: (ii) $-x+1,-y+2,-z+1$; (iii) $x-1, y+1, z$.

Disordered solvent molecules are present in (I). A significant amount of time was invested in identifying and refining the disordered molecule. Bond length restraints were applied to model the molecules but the resulting isotropic displacement coefficients suggested that the molecule was mobile. In addition, the refinement was computationally unstable. Option SQUEEZE of PLATON (Spek, 2003) was used to correct the diffraction data for disordered scattering effects and to identify the solvent molecule. PLATON calculated the upper limit of volume that can be occupied by the solvent to be $289 \AA^{3}$, or $17 \%$ of the unit-cell volume. The program calculated 105 electrons in the unit cell for the diffuse species. This approximately corresponds to two molecules of toluene in the unit cell ( 100 electrons) or two molecules of dichloromethane ( 84 electrons). Note that, while the former possible solvent is closer in the electron count, the latter better corresponds to the results of the elemental analysis and is assumed to be the case here. All H atoms bound to C atoms were placed in idealized locations and refined as riding, with $\mathrm{C}-\mathrm{H}=0.95 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$ for aromatic C atoms, and $\mathrm{C}-\mathrm{H}=0.98 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{C})$ for methyl groups. One of the H atoms on O 3 was treated as riding, with $\mathrm{O}-\mathrm{H}=0.84 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{O})$; for other H atoms attached to atoms O 4 and
$\mathrm{O} 3, \mathrm{O}-\mathrm{H}$ distances were restrained to $0.82 \AA$ and $U_{\text {iso }}$ values were independently refined.

Data collection: SMART (Bruker, 2003); cell refinement: SAINT (Bruker, 2003); data reduction: SAINT; program(s) used to solve structure: SHELXTL (Bruker, 2003); program(s) used to refine structure: SHELXTL; molecular graphics: SHELXTL; software used to prepare material for publication: SHELXTL.
