## Key indicators

Single-crystal X-ray study
$T=153 \mathrm{~K}$
Mean $\sigma(\mathrm{C}-\mathrm{C})=0.006 \AA$
$R$ factor $=0.047$
$w R$ factor $=0.109$
Data-to-parameter ratio $=15.1$
For details of how these key indicators were automatically derived from the article, see http://journals.iucr.org/e.

[^0]
# (Acetonitrile- $\kappa N$ ) $\mathbf{1 , 2 - b i s [ b i s ( p e n t a f l u o r o p h e n y l ) - ~}$ phosphino]ethane- $\left.\kappa^{2} P, P\right\}\left(\boldsymbol{\eta}^{5}\right.$-pentamethylcyclopentadienyl)ruthenium(II) hexafluorophosphate 

#### Abstract

The cation of the title salt, $\left[\mathrm{Ru}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{Me}_{5}\right)(\mathrm{NCMe})\right.$ $\left.\left\{\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2} \mathrm{PCH}_{2} \mathrm{CH}_{2} \mathrm{P}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2}\right\}\right] \mathrm{PF}_{6}$ or $\left[\mathrm{Ru}\left(\mathrm{C}_{10} \mathrm{H}_{15}\right)\left(\mathrm{C}_{26} \mathrm{H}_{4} \mathrm{~F}_{20} \mathrm{P}_{2}\right)\right.$ $\left.\left(\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{~N}\right)\right] \mathrm{PF}_{6}$, has contacts with three anions. One lies close to the pentamethylcyclopentadienyl ring, such that three F atoms of the anion are ca $3.5 \AA$ from two of the ring methyl C atoms of the cation and there is one $\mathrm{H} \cdots \mathrm{F}$ distance shorter than the sum of the van der Waals radii.

## Comment

Salts of the cation $\left[\left(\eta^{5}-\mathrm{C}_{5} \mathrm{Me}_{5}\right) \mathrm{RhCl}\left\{\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2} \mathrm{PCH}_{2} \mathrm{CH}_{2} \mathrm{P}\right.\right.$ $\left.\left.\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2}\right\}\right]^{+}$have been found to undergo intramolecular dehydrofluorinative $\mathrm{C}-\mathrm{C}$ reactions on thermolysis or in the presence of a proton sponge or fluoride, to yield $\left[\left\{\eta^{5}, \kappa P, \kappa P\right.\right.$ $\left.\left.\mathrm{C}_{5} \mathrm{Me}_{4} \mathrm{CH}_{2} \mathrm{C}_{6} \mathrm{~F}_{4}-2-\mathrm{P}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right) \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{P}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2}\right\} \mathrm{RhCl}\right]^{+}$and then $\left[\left\{\eta^{5}, \kappa P, \kappa P-\mathrm{C}_{5} \mathrm{Me}_{3}\left[\mathrm{CH}_{2} \mathrm{C}_{6} \mathrm{~F}_{4}-2-\mathrm{P}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right) \mathrm{CH}_{2}\right]-1,3\right\} \mathrm{RhCl}\right]^{+}$(Atherton et al., 1996; Bellabarba et al., 2001). The thermolysis is dependent on the solvent and the anion. The reaction for the tetrafluoroborate salt occurs only in polar protic solvents, such as ethanol, whereas for chloride, hexafluorophosphate and tetraphenylborate salts, the reaction also occurs readily in non-polar aprotic solvents, such as benzene (Atherton et al., 1999).

The structure of $\left[\left(\eta^{5}-\mathrm{C}_{5} \mathrm{Me}_{5}\right) \mathrm{RhCl}\left\{\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2} \mathrm{PCH}_{2} \mathrm{CH}_{2} \mathrm{P}\right.\right.$ $\left.\left.\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2}\right\}\right] \mathrm{BF}_{4}$ revealed that a tetrafluoroborate anion is positioned close to the pentamethylcyclopentadienyl ligand, such that three F atoms of the anion form a plane almost parallel ( $5.1^{\circ}$ deviation) to the $\mathrm{C}_{5}$ plane, with a separation between the two planes of $c a 3.19 \AA$. The anion is displaced slightly from the $\left(\eta^{5}-\mathrm{C}_{5} \mathrm{Me}_{5}\right)-\mathrm{Rh}$ axis, giving rise to short $\mathrm{F} \cdots \mathrm{H}$ and $\mathrm{F} \cdots \mathrm{C}$ distances between the anion and the pentamethylcyclopentadienyl ligand of 2.4-2.7 and 3.1-3.3 Å, respectively (Atherton et al., 1996). A similar positioning of the anion and cation is found in the related salts $\left[\left(\eta^{5}-\mathrm{C}_{5} \mathrm{Me}_{5}\right) \operatorname{IrCl}\left\{\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2} \mathrm{PCH}_{2} \mathrm{CH}_{2} \mathrm{P}\right.\right.$ $\left.\left.\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2}\right\}\right] \mathrm{BF}_{4}$ (Atherton et al., 1996) and $\left[\left(\eta^{5}-\mathrm{C}_{5} \mathrm{Me}_{5}\right) \mathrm{RhCl}-\right.$ $\left.\left\{\left(\mathrm{C}_{6} \mathrm{H}_{3} \mathrm{~F}_{2}-2,6\right)_{2} \mathrm{PCH}_{2} \mathrm{CH}_{2} \mathrm{P}\left(\mathrm{C}_{6} \mathrm{H}_{3} \mathrm{~F}_{2}-2,6\right)_{2}\right\}\right] \mathrm{BF}_{4}$ (Fawcett et al., 1998). If $\mathrm{BF}_{4}{ }^{-} \cdots \mathrm{C}_{5} \mathrm{Me}_{5}$ interactions are present in aprotic solvents, then the absence of similar anion $\cdots \mathrm{C}_{5} \mathrm{Me}_{5}$ interactions in the salts of the other anions may provide the basis for an explanation for the difference in reactivity. Of particular relevance is the salt of the hexafluorophosphate anion, which is the most similar to the tetrafluoroborate anion. These two anions comprise a periphery of $F$ atoms, with equilateral triangular faces with edges of ca 2.1-2.3 $\AA$ (Allen et al., 1987; Atherton et al., 1996; Fawcett et al., 1998). Unfortunately, crystals suitable for single-crystal X-ray diffraction studies of the non-tetrafluoroborate salts of $\left[\left(\eta^{5}-\mathrm{C}_{5} \mathrm{Me}_{5}\right) \mathrm{RhCl}-\right.$ $\left.\left\{\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2} \mathrm{PCH}_{2} \mathrm{CH}_{2} \mathrm{P}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2}\right\}\right]^{+}$have been elusive. However, the structure of the title isoelectronic ruthenium salt, $\left[\left(\eta^{5}-\right.\right.$ $\left.\left.\mathrm{C}_{5} \mathrm{Me}_{5}\right) \mathrm{Ru}(\mathrm{NCMe})\left\{\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2} \mathrm{PCH}_{2} \mathrm{CH}_{2} \mathrm{P}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2}\right\}\right] \mathrm{PF}_{6}$, (I), has now been determined and is presented here.

Received 26 April 2005 Accepted 24 June 2005 Online 16 July 2005

(I)

The structure of (I) (Fig. 1) reveals that the hexafluorophosphate anion does not adopt a similar position to that of the tetrafluoroborate anion in $\left[\left(\eta^{5}-\mathrm{C}_{5} \mathrm{Me}_{5}\right) \mathrm{RhCl}_{4}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2^{-}}\right.$ $\left.\left.\mathrm{PCH}_{2} \mathrm{CH}_{2} \mathrm{P}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2}\right\}\right] \mathrm{BF}_{4}$ and $\left[\left(\eta^{5}-\mathrm{C}_{5} \mathrm{Me}_{5}\right) \mathrm{RhCl}\left\{\left(\mathrm{C}_{6} \mathrm{H}_{3} \mathrm{~F}_{2}-2,6\right)_{2^{-}}\right.\right.$ $\left.\left.\mathrm{PCH}_{2} \mathrm{CH}_{2} \mathrm{P}\left(\mathrm{C}_{6} \mathrm{H}_{3} \mathrm{~F}_{2}-2,6\right)_{2}\right\}\right] \mathrm{BF}_{4}$. The cation shows contacts to three anions which are shorter than the sum of the van der Waals radii of the respective atoms. One anion position is close to the pentamethylcyclopentadienyl ligand, such that there is one F...H distance shorter than the sum of the van der Waals radii $(\mathrm{F} 36 \cdots \mathrm{H} 10 \mathrm{C}=2.626 \AA)$. The shortest inter-ion $\mathrm{F} \cdots \mathrm{C}\left(\mathrm{C}_{5} \mathrm{Me}_{5}\right)$ distances are between atoms F 34 and C 9 [3.493 (6) Å], F36 and C10 [3.564 (7) Å], and F32 and C10 [3.597 (7) A]. However, for this anion, the shortest inter-ion F. $\cdot \mathrm{C}$ distance of 3.028 (6) $\AA$ is between atoms F36 and C2S of the acetonitrile. The distance between atoms C3S and F36 is 3.123 (5) $\AA$, with $\mathrm{F} 36 \cdots \mathrm{H} 3 S 2=2.609 \AA$, and that between atoms C3S and F34 is 3.396 (7) $\AA$, with F34 $\cdots \mathrm{H} 3 S 2=2.481 \AA$.

Another anion position gives three short contacts with a $\mathrm{C}_{6} \mathrm{~F}_{5}$ ring (F32 $\cdots \mathrm{F} 26 B=2.888(6) \AA, \quad \mathrm{F} 32 \cdots \mathrm{C} 26 B=$ 2.964 (6) $\AA$ and $\mathrm{F} 32 \cdots \mathrm{C} 25 B=3.110$ (6) $\AA$ ) and a contact with a $\mathrm{CH}_{2} \mathrm{H}$ atom $(\mathrm{F} 35 \cdots \mathrm{H} 2 A 2=2.633 \AA)$. The third anion position gives a contact with a $\mathrm{C}_{6} \mathrm{~F}_{5}$ ring ( $\mathrm{F} 31 \cdots \mathrm{C} 14 B=$ 3.113 (7) $\AA$ ), a $\mathrm{CH}_{2} \mathrm{H}$ atom ( $\mathrm{F} 33 \cdots \mathrm{H} 1 A 1=2.599 \AA$ ) and an acetonitrile H atom $(\mathrm{F} 35 \cdots \mathrm{H} 3 S 1=2.428 \mathrm{~A})$.

Figure 1
A view of (I). Displacement ellipsoids are drawn at the $30 \%$ probability level. H atoms have been omitted for clarity.

## Experimental

The title complex was obtained from the reaction of [ $\left(\eta^{5}-\right.$ $\left.\mathrm{C}_{5} \mathrm{Me}_{5}\right) \mathrm{Ru}\left(\mathrm{NCMe}_{3}\right] \mathrm{PF}_{6}$ with $\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2} \mathrm{PCH}_{2} \mathrm{CH}_{2} \mathrm{P}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2}$ in dichloromethane ( 10 ml ) gave a yellow-green solution from which a small number of yellow crystals of (I) were obtained by cooling the reaction mixture to 273 K .
