## Key indicators

Single-crystal X-ray study  
 $T = 293$  K  
Mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å  
 $R$  factor = 0.032  
 $wR$  factor = 0.101  
Data-to-parameter ratio = 12.0For details of how these key indicators were  
automatically derived from the article, see  
<http://journals.iucr.org/e>.

A new polymorph of 2,5-bis(4-pyridyl)-1,3,4-thiadiazole,  $\text{C}_{12}\text{H}_8\text{N}_4\text{S}$ , obtained under hydrothermal conditions, is described. In this structure, the two terminal pyridyl groups are inclined to the central thiadiazole ring with dihedral angles of  $6.47$  (2) and  $29.95$  (5) $^\circ$ , and the dihedral angle between the pyridyl ring planes is  $23.65$  (6) $^\circ$ . An intermolecular  $\text{C}-\text{H}\cdots\text{N}$  weak interaction is observed. The structural differences of two polymorphs of 2,5-bis(4-pyridyl)-1,3,4-thiadiazole are also discussed.

## Comment

Recently, we have reported the crystal structure of 2,5-bis(4-pyridyl)-1,3,4-thiadiazole [form *A*, monoclinic,  $C2/c$ , with lattice parameters of  $a = 26.179$  (9) Å,  $b = 5.8223$  (17) Å,  $c = 7.169$  (3) Å and  $\beta = 105.855$  (9) $^\circ$ ], which is obtained by recrystallizing the commercial product from a hot  $\text{CH}_3\text{OH}/\text{H}_2\text{O}$  solution (Du *et al.*, 2004). During our efforts to investigate the assembly of metal-organic coordination frameworks based on this bent dipyridyl linker, a new polymorph (form *B*), (I), was generated accidentally under hydrothermal conditions; the crystal structure of (I) is described in this paper.

The molecular structure of (I), shown in Fig. 1, contains no crystallographically imposed symmetry; however, a crystallographic twofold axis was detected in the structure of polymorph *A*. The two pyridyl rings make dihedral angles of  $6.47$  (2) and  $29.95$  (5) $^\circ$  with the central thiadiazole system, and the dihedral angle between them is  $23.65$  (6) $^\circ$ . The corresponding values in polymorph *A* are  $21.8$  (2),  $21.8$  (2) and

Figure 1

A view of the molecular structure of (I), with the atom-labeling scheme and 30% probability displacement ellipsoids.

43.0 (2)°, respectively. Selected bond lengths and angles are listed in Table 1. For the pyridyl rings, the C–N bond lengths (mean value 1.329 Å), are within the range of values normally considered standard for single C–N (1.47 Å) and double C=N (1.28 Å) bonds. The C–N bond lengths in the thiadiazole ring are 1.302 (2) and 1.298 (2) Å. All these bond geometries are comparable to those in polymorph *A*. Additionally, the angle between the center of the thiadiazole ring and the two pyridyl N-atom donors is 161°, and the separation of these two N atoms is 10.785 (2) Å. The corresponding parameters in polymorph *A* are 156° and 10.763 (4) Å.

No significant interactions, such as hydrogen bonds or  $\pi$ – $\pi$  stacking, are observed in polymorph *A*. Notably, analysis of the crystal packing of this structure (polymorph *B*) suggests weak C2–H2···N4 intermolecular interactions, resulting in a one-dimensional chain along the [100] direction (Fig. 2). The relevant hydrogen-bonding parameters are listed in Table 2. Additionally, the interplanar distance between two layers of molecules is 3.5–3.8 Å, and the centroid-to-centroid distance is about 3.743 Å, indicating the existence of aromatic stacking interactions. Examination of this structure with *PLATON* (Spek, 2003) reveals no solvent-accessible voids in the unit cell.

## Experimental

A mixture of Zn(OAc)<sub>2</sub>·4H<sub>2</sub>O (21.8 mg, 0.1 mmol), isophthalic acid (16.8 mg, 0.10 mmol), and 2,5-bis(4-pyridyl)-1,3,4-thiadiazole (23.5 mg, 0.1 mmol) in water (10 ml) was heated at 433 K for 3 d in a sealed Teflon-lined stainless steel vessel (20 ml) under autogenous pressure. After the reaction mixture was slowly cooled to room temperature at a rate of 5 K h<sup>−1</sup>, pale-yellow lamellar single crystals suitable for X-ray diffraction were produced.
