## Key indicators

Single-crystal X-ray study
$T=293 \mathrm{~K}$
Mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$
H -atom completeness $77 \%$
Disorder in solvent or counterion
$R$ factor $=0.043$
$w R$ factor $=0.129$
Data-to-parameter ratio $=9.4$
For details of how these key indicators were automatically derived from the article, see http://journals.iucr.org/e.

## (1S,3aR,4S,6aR)-1-(4-Hydroxy-3-methoxyphenyl)-4-(4-hydroxy-3-methylphenyl)perhydrofuro[3,4-c]-furan-3a,6a-diol hexahydrate

In the title compound, $\mathrm{C}_{20} \mathrm{H}_{22} \mathrm{O}_{8} \cdot 6 \mathrm{H}_{2} \mathrm{O}$, the asymmetric unit contains one half-molecule with the other half generated by a crystallographic twofold axis of symmetry. It was extracted from the leaves of Prinsepia utilis Royle and displays powerful anti-oxidant activity.

## Comment

Prinsepia utilis Royle is a shrub plant growing at an altitude of $1000-2500 \mathrm{~m}$ in the south of China and India. Its leaves have been used for various skin diseases, and also for rheumatism, in traditional Chinese medicine. In order to investigate its bioactive natural products, we have undertaken chemical studies on Prinsepia utilis Royle, and have obtained an antioxidant lignan, (I), from an ethyl acetate extract of its leaves. This lignan, prinsepiol, was previously described by Kilidhar et al. (1982). It displays powerful anti-oxidant activity (Piccinelli et al., 2004). An X-ray crystal structure determination of (I) was carried out in order to elucidate its structure and the results are presented here.

The molecular structure of (I) is illustrated in Fig. 1. The asymmetric unit contains one half-molecule. The other half is generated by a crystallographic twofold axis of symmetry; this axis passes through the mid-point of the $\mathrm{C} 1-\mathrm{C} 1 \mathrm{~A}$ bond [symmetry code: (A) $-x+1,-y, z$ ] and is parallel to the $c$ axis of the unit cell. The bond distance $\mathrm{C} 1-\mathrm{C} 1 \mathrm{~A}$ of 1.546 (4) $\AA$ confirms its single-bond character. The atoms of the methoxy group attached to the benzene ring do not deviate substantially from the plane of the ring; the maximum deviation of 0.0833 (3) $\AA$ is observed for atom C10. The dihedral angle between the two benzene rings is $70.9(3)^{\circ}$. As atom C 2 is part of a five-membered ring, it has a distorted tetrahedral geometry, with the $\mathrm{O} 2-\mathrm{C} 2-\mathrm{C} 1\left[104.65(19)^{\circ}\right]$ and $\mathrm{C} 4-\mathrm{C} 2-$ C1 [115.7 (2) ${ }^{\circ}$ ] angles deviating significantly from ideal tetrahedral values. The packing of the molecules in the solid state is stabilized by $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ intermolecular interactions; Table 1 lists the hydrogen-bond contacts. The relative configuration of the two asymmetric C atoms in the asymmetric unit and the cis orientation of the fused five-membered rings are established by this determination.

A view of the molecule (I) showing the atom-labeling scheme. Displacement ellipsoids are drawn at the $30 \%$ probability level. Water molecules have been omitted.

## Experimental

The leaves of Prinsepia utilis Royle were dried at 313 K in the dark. The material ( 1.3 kg ) was refluxed three times with $95 \%$ EtOH (10 l each time). The extract was concentrated under reduced pressure to give a residue ( 190 g ) which was partitioned between ethyl acetate and water. The EtOAc layer was concentrated to a residue of 28 g . Chromatographic separation was performed on a silica-gel column, using solvents of increasing polarity as mobile phases to give 16 fractions. Fraction 11 ( 2 g ) was chromatographed on Sephadex LH-20 $(\mathrm{MeOH})$ to give five fractions (11.1-11.5). Fraction 11.4 ( 280 mg ) was separated by high-performance liquid chromatography (HPLC) to give 12 fractions (11.4.1-11.4.12). Fraction 11.4 .3 ( 31 mg ) was separated by HPLC to give the pure title compound, (I) (m.p. 464-465 K). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CD}_{3} \mathrm{OD}\right): \delta 148.8,147.6,129.7,121.7,115.7,113.0,89.2$, 88.5, 76.9, 56.5. Crystals suitable for X-ray structure analysis were obtained by slow evaporation of a solution in methanol and water at room temperature.

## Crystal data

$\mathrm{C}_{20} \mathrm{H}_{22} \mathrm{O}_{8} \cdot 6 \mathrm{H}_{2} \mathrm{O}$
$M_{r}=498.47$
Orthorhombic, $P 2_{1} 2_{1} 2$
$a=19.060$ (3) $\AA$
$b=6.6887$ (11) $\AA$
$c=9.3752$ (16) $\AA$
$V=1195.2(3) \AA^{3}$
$Z=2$
$D_{x}=1.385 \mathrm{Mg} \mathrm{m}^{-3}$

## Data collection

Bruker SMART CCD area-detector diffractometer
$\varphi$ and $\omega$ scans
Absorption correction: multi-scan (SADABS; Sheldrick, 1996)
$T_{\text {min }}=0.972, T_{\text {max }}=0.981$
7991 measured reflections

Mo $K \alpha$ radiation
Cell parameters from 1916 reflections
$\theta=2.4-22.1^{\circ}$
$\mu=0.12 \mathrm{~mm}^{-1}$
$T=293$ (2) K
Block, colorless
$0.26 \times 0.20 \times 0.16 \mathrm{~mm}$

1692 independent reflections
1270 reflections with $I>2 \sigma(I)$
$R_{\text {int }}=0.038$
$\theta_{\text {max }}=28.0^{\circ}$
$h=-24 \rightarrow 25$
$k=-6 \rightarrow 8$
$l=-12 \rightarrow 12$

## Refinement

Refinement on $F^{2}$
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}{ }^{2}\right)+(0.0873 P)^{2}\right]$
where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.043$
$w R\left(F^{2}\right)=0.129$
$(\Delta / \sigma)_{\max }<0.001$ 。
$S=1.04$
$\Delta \rho_{\max }=0.28 \mathrm{e}_{\AA^{-3}}$
1692 reflections
$\Delta \rho_{\min }=-0.17 \mathrm{e}^{-3}$
180 parameters
H -atom parameters constrained
Extinction correction: SHELXL97
Extinction coefficient: 0.005 (4)

Table 1
Hydrogen-bond geometry ( $\AA,^{\circ}$ ).

| $D-\mathrm{H} \cdots A$ | $D-\mathrm{H}$ | $\mathrm{H} \cdots A$ | $D \cdots A$ | $D-\mathrm{H} \cdots A$ |
| :---: | :---: | :---: | :---: | :---: |

| $\mathrm{O} 1-\mathrm{H} 1 \cdots \mathrm{O}$ | 0.82 | 1.93 | 2.732 (3) | 167 |

Symmetry codes: (i) $x, y-1, z$; (ii) $-x+1,-y+1, z$; (iii) $-x+\frac{3}{2}, y+\frac{1}{2},-z+1$.
All H atoms were positioned geometrically ( $\mathrm{C}-\mathrm{H}=0.93-0.97 \AA$ and $\mathrm{O}-\mathrm{H}=0.82-0.85 \AA$ ) and refined as riding. For the CH and $\mathrm{CH}_{2}$ groups, $U_{\text {iso }}(\mathrm{H})$ values were set equal to $1.2 U_{\text {eq }}$ (carrier atom) and for the methyl groups they were set equal to $1.5 U_{\text {eq }}$ (carrier atom). The asymmetric unit contains three $\mathrm{H}_{2} \mathrm{O}$ molecules. One of these, O , was ordered (i.e. it displayed full occupancy), although one of its H atoms was disordered equally over two sites. The other two water molecules were distributed over five sites, O6-O10, with partial occupancies of 0.64 (1), 0.36 (1), 0.692 (7), 0.183 (7) and 0.125 (9), respectively. H atoms on the disordered waters were not found or positioned, but they were assumed to be present when calculating the molecular weight of the asymmetric unit and the crystal density. Anomalous dispersion effects were too small to establish the absolute configuration, so the Friedel equivalents were merged in the refinement.

Data collection: SMART (Bruker, 1997); cell refinement: SAINT (Bruker, 1997); data reduction: SAINT; program(s) used to solve structure: SHELXS97 (Sheldrick, 1997); program(s) used to refine structure: SHELXL97 (Sheldrick, 1997); molecular graphics: SHELXTL (Bruker, 1997); software used to prepare material for publication: SHELXTL.
