## Propane-1,2-diaminium hydrogenarsenate

The title compound, $\left(\mathrm{C}_{3} \mathrm{H}_{12} \mathrm{~N}_{2}\right)\left[\mathrm{AsHO}_{4}\right]$, is a molecular salt containing a network of propane-1,2-diaminium cations and hydrogenarsenate anions [mean As-O 1.686 (2) Å]. The crystal packing involves cation-to-anion $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and anion-to-anion $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, the latter resulting in dimeric associations of two adjacent hydrogenarsenate anions.

## Comment

The title compound, (I) (Fig. 1), was prepared as part of our ongoing structural studies of hydrogen-bonding interactions in protonated-amine (di)hydrogenarsenates (Todd \& Harrison, 2005).

(I)

The $\left[\mathrm{HAsO}_{4}\right]^{2-}$ hydrogenarsenate group in (I) shows its normal tetrahedral geometry [mean As-O 1.686 (2) Å], with the protonated As1-O4 vertex showing its usual lengthening relative to the unprotonated $\mathrm{As}-\mathrm{O}$ bonds (Table 1). The propane-1,2-diaminium cation is disordered over two overlapped positions (Fig. 1). This positional disorder manifests itself as a terminal methyl group (atoms C3 or C4) being attached to either C 1 or C 2 , with $50 \%$ occupancy in each case. The N atoms and atoms C 1 and C 2 of the two orientations of the cation are not resolved. Allowing for the disorder, this ion is chiral, but crystal symmetry generates a $50: 50 \mathrm{mix}$ of enantiomers, which is consistent with the racemic starting material. Atoms N1 and N2 are close to being trans with respect to the $\mathrm{C} 1-\mathrm{C} 2$ backbone of the molecule (Table 1 ).

Figure 1
A view of (I), showing $50 \%$ probability displacement ellipsoids, with H atoms drawn as spheres of arbitrary radius. C-bound H atoms have been omitted for clarity and the hydrogen bond is indicated by a dashed line. Bonds to the disordered atoms C3 and C4 (see text) are shown as open lines.

Received 7 September 2005 Accepted 12 September 2005 Online 17 September 2005

Figure 2
The packing for (I), with all C-bound H atoms omitted for clarity. Hydrogen bonds are indicated by dashed lines.

As well as electrostatic attractions, the component species in (I) interact by means of a network of $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-$ $\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Table 2). The $\left(\mathrm{HAsO}_{4}\right)^{2-}$ units are linked into inversion-generated dimeric pairs by way of the $\mathrm{O} 4-\mathrm{H} 1 \cdots \mathrm{O} 2^{\mathrm{i}}$ bond (see Table 2 for symmetry code), with a resulting As $1 \cdots$ As $1^{i}$ separation of 4.3963 (4) $\AA$. This situation is distinct from that observed in related materials, where chains (Lee \& Harrison, 2003) and sheets (Wilkinson \& Harrison, 2005) of (di)hydrogenarsenate ions linked by $\mathrm{O}-$ $\mathrm{H} \cdots \mathrm{O}$ bonds are seen.

In (I), the organic species interacts with the hydrogenarsenate dimers by way of six $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds [mean $\mathrm{H} \cdots \mathrm{O} 1.85 \AA$, mean $\mathrm{N}-\mathrm{H} \cdots \mathrm{O} 170^{\circ}$ and mean $\mathrm{N} \cdots \mathrm{O}$ 2.744 (3) Å]. Atoms O1, O2 and O3 accept two $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ bonds each. This hydrogen-bonding scheme results in a threedimensional network (Fig. 2).

## Experimental

Aqueous propane-1,2-diamine solution ( $0.5 \mathrm{M}, 10 \mathrm{ml}$ ) was added to aqueous $\mathrm{H}_{3} \mathrm{AsO}_{4}$ solution ( $0.5 \mathrm{M}, 10 \mathrm{ml}$ ) to result in a clear mixture. Aqueous ammonia was added to this solution to raise the pH to about 12 , which is beyond the second end-point for $\mathrm{H}_{3} \mathrm{AsO}_{4}$ (i.e. the predominant solution species is $\mathrm{HAsO}_{4}{ }^{2-}$ ). Crystals of (I) grew as the water evaporated over the course of a few days.

Symmetry codes: (i) $-x+1,-y,-z$; (ii) $x, y+1, z$; (iii) $-x+\frac{1}{2}, y+\frac{1}{2},-z+\frac{1}{2}$; (iv)
$-x+1,-y+1,-z ;$ (v) $x+\frac{1}{2},-y+\frac{1}{2}, z+\frac{1}{2} ;$ (vi) $x+\frac{1}{2},-y+\frac{3}{2}, z+\frac{1}{2}$.
The organic cation is orientationally disordered, such that the two positions of atoms $\mathrm{N} 1, \mathrm{~N} 2, \mathrm{C} 1$, and C 2 overlap and cannot be resolved. The site-occupation factors of atoms C3 and C4 refined to $50 \%$ within experimental error and were both fixed at 0.50 for the final cycles of refinement. The O-bound H atom was found in a difference map and refined as riding in its as-found relative position. The H atoms bonded to C and N were located in idealized positions, with $\mathrm{N}-\mathrm{H}=0.91 \AA$ and $\mathrm{C}-\mathrm{H}=0.98-0.99 \AA$, and refined as riding, allowing for free rotation of the $-\mathrm{NH}_{3}$ groups. The constraint $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}($ carrier $)$ or $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}$ (methyl carrier) was applied.

Data collection: COLLECT (Nonius, 1998); cell refinement: HKL SCALEPACK (Otwinowski \& Minor, 1997); data reduction: HKL DENZO (Otwinowski \& Minor 1997), SCALEPACK and SORTAV (Blessing 1995); program(s) used to solve structure: SHELXS97 (Sheldrick, 1997); program(s) used to refine structure: SHELXL97 (Sheldrick, 1997); molecular graphics: ORTEP3 (Farrugia, 1997); software used to prepare material for publication: SHELXL97.

We thank the EPSRC National Crystallography Service (University of Southampton) for the data collection.
