## Key indicators

Single-crystal X-ray study  
*T* = 299 K  
Mean  $\sigma(C-C)$  = 0.006 Å  
*R* factor = 0.071  
*wR* factor = 0.220  
Data-to-parameter ratio = 16.4

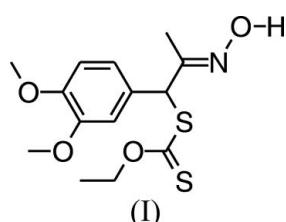

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

The stereogenic centre in the title compound,  $C_{14}H_{19}NO_4S_2$ , is substituted with a dithiocarbonate, an ethyloximino and a 3,4-dimethoxyphenyl group, as well as an H atom. Tandem hydrogen-bonding occurs between enantiomers to produce dimers, in which the oxime H atom serves as donor toward the oxime N atom of an adjacent molecule.

## Comment

The title compound, (I), is the starting material for the synthesis of *N*-hydroxy-5-(3,4-dimethoxyphenyl)-4-methylthiazole-2(3*H*)-thione, a molecule of notable interest for investigating substituent effects on the location of absorption bands caused by visible to near-UV light excitations in heterocyclic alkoxy radical precursors (Hartung, Špehar *et al.*, 2005). Compound (I) has been crystallized and studied by X-ray diffraction in order to gain an understanding of its structural details in the solid state.

The stereogenic centre, atom C4, is substituted by three virtually planar groups, *viz* a 3,4-dimethoxyphenyl, an *O*-ethyl dithiocarbonate and an ethyloximino group, and by one H atom (Fig. 1). The heteroatoms and the central C atom of the dithiocarbonate group are located in a plane [deviation of O2 = 0.012 (1) Å]. The stereogenic bonds associated with the latter entity adopt an (*E*) arrangement for C1—S2 and (*Z*) geometry for C1—O2. The C1—S1 distance [1.639 (4) Å] is smaller than the mean value for the C=S double bond in *O,S*-dialkyldithiocarbonates [1.67 (2) Å; Abrahamsson & Innes, 1974; Allen *et al.*, 1987; Duarte *et al.*, 1989]. The connectivities S2—C1 and S2—C4 differ in length due to different hybridization of the associated C atoms (Zhang *et al.*, 2003, Hartung, Schmidt *et al.*, 2005). The oxime group adopts an (*E*) configuration. The distances N1—O1 and N1=C3 agree with mean values for both types of connectivities (Allen *et al.*, 1987; Hartung *et al.*, 2004).

The unit cell (*Z* = 4) contains a 1:1 mixture of (*S*) and (*R*) enantiomers. A view along [001] indicates that these enantiomers are linked *via* a tandem hydrogen bond to provide dimers. The oxime H atom serves as the donor toward the oxime N atom of an adjacent molecule (Fig. 2 and Table 2).
