## Key indicators

Single-crystal X-ray study  
T = 293 K  
Mean  $\sigma(\text{C}-\text{C}) = 0.023 \text{ \AA}$   
R factor = 0.048  
wR factor = 0.083  
Data-to-parameter ratio = 22.0For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

The coordination of the  $[\text{Cd}(\text{acetamide})_6]^{2+}$  cation in the title compound, hexaacetamidcadmium(II) bis(triiodide) bis(diiodine),  $[\text{Cd}(\text{C}_2\text{H}_5\text{NO})_6](\text{I}_3)_2 \cdot 2\text{I}_2$ , is octahedral. The I atoms form a woven structure consisting of alternating triiodide anions and iodine molecules. Cd atoms and triiodide anions lie on inversion centres.

## Comment

Polyiodides have earned much deserved attention because of their fascinating structural chemistry (Svensson & Kloo, 2003). Interest in polyiodides has also focused on materials with unusually high electrical conductivity, in which polyiodide species are involved in conduction processes. For example, transition metal complex polyiodides with acetamide were found to have a specific electrical conductivity of  $10^{-4} \text{ S cm}^{-1}$  (Savinkina *et al.*, 1998). In this work, we report the crystal structure of (I), a cadmium polyiodide complex with acetamide (Fig. 1).

In this compound, acetamide molecules coordinate to Cd to yield  $[\text{Cd}(\text{acetamide})_6]^{2+}$  cations with an octahedral  $\text{CdO}_6$  coordination geometry. The acetamide ligands form hydrogen bonds with two neighbouring complex cations (Table 2) to give infinite chains. The I atoms form infinite zigzag chains to give a woven structure (Fig. 2). Consideration of the bond lengths (Table 1) in the iodine chain suggests the presence of triiodide anions ( $\text{I}^{\text{I}}-\text{I}^{\text{II}}-\text{I}^{\text{III}}$  and  $\text{I}^{\text{IV}}-\text{I}^{\text{V}}-\text{I}^{\text{VI}}$ , symmetry codes as in Table 1) alternating with iodine molecules ( $\text{I}^{\text{I}}-\text{I}^{\text{II}}$ ). The  $\text{I}^{\text{I}} \cdots \text{I}^{\text{IV}}$  and  $\text{I}^{\text{II}} \cdots \text{I}^{\text{V}}$  distances are somewhat longer, 3.4680 (18) and 3.4371 (18)  $\text{ \AA}$ , respectively. They are greater than the sum of covalent radii (2.66  $\text{ \AA}$ ) but less than the sum of

ORTEP-3 (Farrugia, 1997) view and numbering scheme of compound (I). Displacement ellipsoids are drawn at the 50% probability level. The suffixes a, b and c correspond to symmetry codes (i), (ii) and (iii), respectively, in Table 1.

van der Waals radii (4.3 Å), indicative of weak bonding interactions.

Compound (I) represents a rare example of a cadmium polyiodide that contains no Cd–I bonds. In the structure of [Cd(12-crown-4)]<sub>2</sub>I<sub>10</sub> (Wieczorrek, 2000), the isolated I<sub>10</sub><sup>2-</sup> ion is found; it can be described as a dimer of V-shaped I<sub>5</sub><sup>-</sup> ions. In all other reported cadmium polyiodides, iodine molecules are linked to iodide ions that are bonded to Cd atoms.

## Experimental

Cadmium iodide (1 g), acetamide (1 g) and iodine (1.4 g) were powdered in a porcelain mortar. The mixture was dissolved in water (15 ml) and heated to 333 K. Excess iodine was removed. Cooling the solution to room temperature gave green crystals decomposing in air (yield 10%). Crystals suitable for the X-ray diffraction study were prepared by crystallization from ethanol at room temperature.

### Crystal data

[Cd(C <sub>2</sub> H <sub>5</sub> NO) <sub>6</sub> ](I <sub>3</sub> ) <sub>2</sub> ·2I <sub>2</sub>	Z = 1
