## catena-Poly[[[tris(pyridine- $\kappa N$ )copper(II)]- $\mu$-3-carboxylatophenoxyacetato- $\left.\kappa^{2} O^{3}: O^{\prime}\right]$ trihydrate]

The 3-carboxyphenoxyacetate ligand in the title compound, $\left[\mathrm{Cu}\left(\mathrm{C}_{9} \mathrm{H}_{6} \mathrm{O}_{5}\right)\left(\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}\right)_{3}\right] \cdot 3 \mathrm{H}_{2} \mathrm{O}$, links adjacent tripyridinecopper(II) groups into a helical chain, which runs along the $c$ axis of the hexagonal unit cell. The covalently bonded O atoms occupy trans sites in the basal plane of the squarepyramidal coordination of the Cu atom. The uncoordinated water molecules connect the chains into a three-dimensional network.

## Comment

We are interested in metal complexes with carboxyphenoxyacetate because the dianion is a multidentate ligand with both rigid and flexible parts. We present here the crystal structure of the title $\mathrm{Cu}^{\text {II }}$ complex, (I), in which 3-carboxyphenoxyacetate plays the role of bridging ligand.

The $\mathrm{Cu}^{\mathrm{II}}$ atom has a square-pyramidal coordination geometry (Fig. 1 and Table 1). The $\mathrm{O}_{2} \mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{O}-\mathrm{CH}_{2}-\mathrm{CO}_{2}$ dianion links adjacent tripyridinecopper(II) cations into a helical chain, which runs along the $c$ axis of the hexagonal unit cell (Fig. 2). The uncoordinated water molecules connect neighboring chains into a three-dimensional network through hydrogen bonds (Table 2). In the chain, the copper shows square-pyramidal coordination, with the covalently bonded O atoms occupying trans sites of the basal plane.

Other $\mathrm{O}_{2} \mathrm{CC}_{6} \mathrm{H}_{4} \mathrm{OCH}_{2}-\mathrm{CO}_{2} \mathrm{Cu}$ adducts that have been characterized include the imidazole adduct, in which the ether O atom is also involved in coordination (Gao et al., 2004a), and the benzimidazole adduct, in which the dianion functions in the $\mu_{4}$-bridging mode (Gao et al., 2004b). In this pyridine adduct, each carboxylate end of the dianion is only monodentate to copper.

## Experimental

Copper dinitrate hexahydrate ( $1.48 \mathrm{~g}, 5 \mathrm{mmol}$ ) and a slight excess of pyridine ( 1 ml ) were added to an aqueous solution of 3-carboxy-

Symmetry codes: (i) $-x+1,-y, z-\frac{1}{2}$; (ii) $-y+1, x-y, z-\frac{1}{3}$.
C-bound H atoms were placed in calculated positions $[\mathrm{C}-\mathrm{H}=0.93$ (aromatic) and $0.97 \AA$ (methylene)] and included in the refinement as riding $\left[U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})\right]$. Water H atoms were placed in chemically sensible positions on the basis of hydrogen-bonding interactions but were not refined $\left[U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{O})\right]$.
