## Key indicators

Single-crystal X-ray study  
 $T = 120$  K  
Mean  $\sigma(\text{C}-\text{C}) = 0.002$  Å  
Disorder in solvent or counterion  
 $R$  factor = 0.049  
 $wR$  factor = 0.132  
Data-to-parameter ratio = 14.9For details of how these key indicators were  
automatically derived from the article, see  
<http://journals.iucr.org/e>.

In the title compound [systematic name: 2,4-diamino-5-(3,4,5-trimethoxybenzyl)pyrimidinium tetrafluoroborate],  $\text{C}_{14}\text{H}_{19}\text{N}_4\text{O}_3^+\cdot\text{BF}_4^-$ , the trimethoprim (TMP) molecule is protonated at one of the pyrimidine N atoms. The protonated N atom and 2-amine group of the TMP cation interact with the tetrafluoroborate anion through a pair of  $\text{N}-\text{H}\cdots\text{F}$  hydrogen bonds [graph set  $R_2^2(8)$ ]. The inversion-related TMP cations are linked through a pair of  $\text{N}-\text{H}\cdots\text{N}$  hydrogen bonds. The 2-amine group of one TMP cation and the 4-amine group of another cation are bridged by a methoxy O atom, *via*  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds.

## Comment

Trimethoprim [2,4-diamino-5-(3',4',5'-trimethoxybenzyl)-pyrimidine or TMP] is a well known antifolate drug. It is a potent inhibitor of bacterial dihydrofolate reductase (DHFR) but is less effective against human DHFR. The drug (TMP) in its N1-protonated form inhibits DHFR. The crystal structure of trimethoprim (Koetzle & Williams, 1976) and its complexes, for example, trimethoprim monobenzoate benzoic acid (Bettinetti *et al.*, 1985) and trimethoprim acetate (Bryan *et al.*, 1987), have been reported in the literature. The present study has been undertaken to explore the hydrogen-bonding patterns involving the TMP cation in a variety of environments. The crystal structures of TMP sulfate trihydrate (Muthiah *et al.*, 2001), TMP nitrate (Murugesan & Muthiah, 1997) and TMP carboxylates (Stanley *et al.*, 2005) have also been reported from our laboratory.

The asymmetric unit of (I) contains a protonated trimethoprim (TMP) cation and a tetrafluoroborate anion (FLUB) (Fig. 1). The trimethoprim molecule is protonated at atom N1 of the pyrimidine moiety, which is evident from the increase in the internal angle at protonated N1 [ $\text{C}2-\text{N}1-\text{C}6 = 120.15$  ( $13^\circ$ )] compared with that at unprotonated atom N3 [ $\text{C}2-\text{N}3-\text{C}4 = 118.36$  ( $14^\circ$ )]. The dihedral angle between the pyrimidine and benzene planes is  $84.27$  ( $7^\circ$ ); the corresponding angle in trimethoprim perchlorate is  $83.7$  ( $2^\circ$ ) (Muthiah *et al.*, 2002). The conformation of the trimethoprim cation is described by the two torsion angles  $\text{C}4-\text{C}5-\text{C}7-\text{C}8$  and  $\text{C}5-\text{C}7-\text{C}8-\text{C}9$ , which are  $77.84$  ( $19^\circ$ ) and

**Figure 1**  
A view of (I), with the atom-labelling scheme and 50% probability displacement ellipsoids.

$-158.03(14)^\circ$ , respectively. The distorted tetrahedral  $\text{BF}_4$  ion has typical B–F distances.

Atoms F2 and F1 act as acceptors in N–H $\cdots$ F interactions (Table 2) with the protonated pyrimidine N1 and 2-amine group of the TMP cation, leading to the formation of a fork-like hydrogen-bonding pattern with graph-set notation  $R_2^2(8)$  (Etter, 1990; Bernstein *et al.*, 1995). The  $R_2^2(8)$  motif is frequently observed in aminopyrimidine carboxylate salts (Lynch & Jones, 2004). Here the tetrafluoroborate anion mimics the role of the carboxylate group. The TMP cations are paired centrosymmetrically through N4–H4A $\cdots$ N3<sup>iii</sup> and N3 $\cdots$ H4A<sup>iii</sup>–N4<sup>iii</sup> hydrogen bonds (symmetry codes are given in Table 2). The 2-amine group of one TMP cation and the 4-amine group of another cation (both of these cations being members of a base pair) are bridged by methoxy atom O1, using a pair of N–H $\cdots$ O hydrogen bonds, leading to a complementary DADA (*D* = donor in hydrogen bonds, *A* = acceptor in hydrogen bonds) array of quadruple hydrogen bonds (Fig. 2). This pattern is similar to that reported in TMP nitrate (Murugesan & Muthiah, 1997), TMP trifluoroacetate (Francis *et al.*, 2002), and TMP salicylate methanol solvate (Panneerselvam *et al.*, 2002). The hydrogen-bonding parameters are listed in Table 2.

## Experimental

Hot aqueous solutions of trimethoprim (145 mg; obtained as a gift sample from Shilpa Antibiotics Ltd) and tetrafluoroboric acid (220 mg of 40% solution; Aldrich) were mixed in a 1:2 molar ratio. The resulting solution was warmed over a water bath for a few minutes and then kept at room temperature for crystallization. After a few days, block-shaped colourless crystals of (I) were obtained.

Symmetry codes: (i)  $x, y + 1, z - 1$ ; (ii)  $x + 1, y, z - 1$ ; (iii)  $-x + 1, -y + 1, -z$ ; (iv)  $-x, -y + 1, -z + 1$ ; (v)  $-x, -y + 2, -z + 1$ ; (vi)  $x - 1, y, z$ .

All H atoms were placed in idealized locations and were refined using a riding model, with C–H = 0.95–0.99  $\text{\AA}$ , N–H = 0.88  $\text{\AA}$  and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{N})$ . Two of the F atoms in the  $\text{BF}_4$  group are disordered over two positions, and the occupancy factors for the disordered positions F3A/F3B and F4A/F4B were refined to 0.60 (2)/0.40 (2). Similarity restraints were applied to distances involving disordered atoms.
