## Key indicators

Single-crystal X-ray study
$T=293 \mathrm{~K}$
Mean $\sigma(\mathrm{C}-\mathrm{C})=0.007 \AA$
$R$ factor $=0.070$
$w R$ factor $=0.156$
Data-to-parameter ratio $=8.4$

For details of how these key indicators were automatically derived from the article, see http://journals.iucr.org/e.

## Maleopimaric anhydride ethyl ester

The title compound, $\mathrm{C}_{26} \mathrm{H}_{36} \mathrm{O}_{5}$, is a derivative of abietic acid formed by an endo-Diels-Alder reaction between maleic anhydride and the diene levopimaric acid ethyl ester. The two fused and unbridged cyclohexane rings have chair conformations and the anhydride ring is planar.

## Comment

Rosin, a versatile natural resin, possesses a rare combination of many desirable properties and has consequently found innumerable industrial uses in a modified form or in conjunction with other natural or synthetic resins (McCoy, 2000). Abietic acid is the major component of colophony (rosin) and is used as a chiral staring material and a useful synthetic intermediate (Arno et al., 2000). Numerous commonly used products can be made from abietic acid, such as paper sizing, printing inks, adhesives, glues, technical resins, synthetic rubber, cosmetics and dental materials (Burge, 1981; Downs et al., 1999).

(I)

The title compound, (I), whose structure is reported here, is a Diels-Alder adduct of ethyl abietate and maleic anhydride; during the reaction, ethyl abietate is isomerized to levopimaric

Figure 1
Molecular structure of (I), showing the atom-labeling scheme and $30 \%$ probability displacement ellipsoids.

acid ethyl ester. The two fused and unbridged cyclohexane rings have chair conformations and the anhydride ring is planar. The configuration about the $\mathrm{C} 9=\mathrm{C} 10$ bond is $Z$ (Fig. 1, Table 1). This maleated rosin has commercial applications in the manufacture of paper sizing, varnishes and surface coatings.

## Experimental

Ethyl abietate was obtained as a pale-yellow oil following the procedure of Abad et al. (1985). A solution of maleic anhydride $(9.8 \mathrm{~g})$, ethyl abietate ( 16.5 g ) and 4 drops of phosphoric acid in toluene ( 70 ml ) was stirred and heated at 388 K for 6 h (Lee et al., 2001). The solution was cooled, diluted with $\mathrm{CHCl}_{3}(50 \mathrm{ml})$, washed with water $(60 \mathrm{ml})$, dried $\left(\mathrm{MgSO}_{4}\right)$, and concentrated to dryness. Recrystallization from ethyl acetate afforded the adduct, (I) ( 13.5 g , $70 \%$ ), as colourless crystals.

## Crystal data

$$

In the absence of significant anomalous dispersion effects, Friedel pairs were averaged. H atoms were placed in idealized positions and allowed to ride on the respective parent atoms with $\mathrm{C}-\mathrm{H} 0.93-$ $0.97 \AA$, and $U_{\text {iso }}(\mathrm{H})=1.2-1.5 U_{\text {eq }}($ parent atom $)$.

Data collection: SMART (Bruker, 2000); cell refinement: SAINT (Bruker, 2000); data reduction: SAINT; program(s) used to solve structure: SHELXS97 (Sheldrick, 1997); program(s) used to refine structure: SHELXL97 (Sheldrick, 1997); molecular graphics: SHELXTL/PC (Sheldrick, 1999); software used to prepare material for publication: SHELXL97.

This work was financially supported by the National 973 Programme of China (contract No. 2003CB114400).
