The title compound,  $\text{C}_{19}\text{H}_{14}\text{ClN}$ , was synthesized by *N*-alkylation of carbazole with 1-chloro-4-(chloromethyl)benzene. The carbazole ring system is essentially planar and makes a dihedral angle of  $109.6(5)^\circ$  with the plane of the benzene ring.

**Comment**

Carbazole derivatives substituted by *N*-alkylation possess valuable pharmaceutical properties (Buu-Hoï & Royer, 1950; Harfenist & Joyner, 1983; Caulfield *et al.*, 2002; Harper *et al.*, 2002). In this paper, the structure of 9-(4-chlorobenzyl)-9H-carbazole, (I) (Fig. 1), is reported. This was synthesized by *N*-alkylation of carbazole with 1-chloro-4-(chloromethyl)benzene (see *Experimental*).

The carbazole ring system in (I) is essentially planar, with a mean deviation of  $0.0261$  Å for non-H atoms. The dihedral angle formed between the carbazole ring system and the plane of the benzene ring (C14–C19) is  $109.6(5)^\circ$ . The C17–Cl1 distance [ $1.739(2)$  Å] is consistent with the literature, as are all other dimensions (Table 1) (Allen *et al.*, 1987; Huang *et al.*, 2005).

**Experimental**

The title compound was prepared according to the procedure of Duan *et al.* (2005). A solution of potassium hydroxide (7.0 g) in dimethylformamide (50 ml) was stirred at 298 K for 20 min. Carbazole (3.34 g, 20 mmol) was added and the mixture stirred for a further 40 min. A solution of 1-chloro-4-(chloromethyl)benzene (4.83 g, 30 mmol) in dimethylformamide (50 ml) was added dropwise with stirring. The resulting mixture was then stirred at 298 K for 12 h and

poured into water (500 ml), yielding a white precipitate. The solid product was filtered off, washed with cold water and recrystallized from EtOH, giving crystals of (I). Yield: 5.26 g (90.2%); m.p. 400–401 K. Compound (I) (40 mg) was dissolved in a mixture of chloroform (5 ml) and ethanol (5 ml) and the solution was kept at 298 K. Slow evaporation over a period of 16 d gave colourless crystals suitable for X-ray analysis.
