## trans-Bis(4-aminopyridine- $\kappa N$ )bis(succinimidato$\kappa N$ )copper(II) dihydrate

The title compound, $\left[\mathrm{Cu}\left(\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{NO}_{2}\right)_{2}\left(\mathrm{C}_{5} \mathrm{H}_{6} \mathrm{~N}_{2}\right)_{2}\right] \cdot 2 \mathrm{H}_{2} \mathrm{O}$, has its metal atom in a square-planar trans- $\left[\mathrm{CuN}_{4}\right]$ coordination environment; the $\mathrm{Cu}^{\mathrm{II}}$ atom lies on a center of symmetry. Both succinimidate and 4 -aminopyridine ligands behave as monodentate ligands, which coordinate through deprotonated imidate and pyridine (not amino) N atoms, respectively. The 4 -aminopyridine is the first ligand in such $\mathrm{Cu}^{\mathrm{II}}$ complexes containing two different N atoms to take potentially different coordination modes.

## Comment

Recently, supramolecular self-assembling metal-organic frameworks of transition-metal complexes have been studied widely (Eddaoudi et al., 2001; Evans et al., 2002; Yaghi et al., 1998). In particular, rational design of crystals as well as molecular structures with anisotropy may be important fundamentals in the production of optical and electronic functional materials. It has been found that $\mathrm{Cu}^{\text {II }}$ complexes show flexible coordination geometries and electronic states (Hathaway \& Billing, 1970). We have reported that the tetragonal Jahn-Teller distortion can be affected by the external temperature or light irradiation for $\mathrm{Cu}^{\mathrm{II}}$ complexes with amine ligands (Akitsu \& Einaga, 2003). Succinimidate ligands give rise to square-planar $\mathrm{CuN}_{4}$ complexes, not only with four identical ligands (Akitsu, Komorita \& Urushiyama, 2001) but also with mixed ligands such as trans-forms with two succinimidate and two monodentate amine ligands (Akitsu,

The molecular structure of (I), showing the atom-labeling scheme. Displacement ellipsoids are drawn at the $30 \%$ probability level. [Symmetry code: (i) $-x,-y,-z$.]

Received 17 January 2006 Accepted 20 February 2006

Komorita \& Kushi, 2001). Furthermore, five-coordinate $\mathrm{CuN}_{4} \mathrm{O}$ or six-coordinate $\mathrm{CuN}_{4} \mathrm{O}_{2}$ square-bipyramidal chromophores have been reported for cis-forms with bidentate diimine (Akitsu et al., 1999) or bidentate amine (Akitsu \& Komorita, 2002). However, the related $\mathrm{Cu}^{\mathrm{II}}$ complexes with amine ligands containing two different coordinating N atoms have not been reported so far. Here, we report the crystal structure of the title compound, (I), incorporating 4-aminopyridine ligands with competitive amino and pyridine N -atom sites.

(I)

In (I) (Fig. 1), the Cu atom exists in a square-planar $\mathrm{CuN}_{4}$ coordination geometry; it lies on an inversion center. Both succinimidate and 4 -aminopyridine ligands behave as monodentate. The $\mathrm{Cu}-\mathrm{N}$ bond distances, the $\mathrm{N}-\mathrm{Cu}-\mathrm{N}$ bond angles, and other geometric parameters of the ligands (Table 1) are comparable to those of the analogous $\mathrm{Cu}^{\mathrm{II}}$ complexes with pyridine derivative ligands (Latavalya \& Taylor, 1975). The $\mathrm{C} 1-\mathrm{N} 1-\mathrm{C} 4$ angle of $110.2(4)^{\circ}$ indicates the $s p^{2}$ character of the deprotonated N 1 atom; the $\mathrm{O} 1-\mathrm{C} 1-\mathrm{N} 1$ and $\mathrm{O} 2-\mathrm{C} 4-$ N 1 angles of 123.6 (4) and 124.6 (4) ${ }^{\circ}$, respectively, also reflect electron delocalization in the $\pi$-conjugated system, similar to the $\mathrm{Cu}^{\mathrm{II}}$ complexes with 5,5-diphenylhydantoinate ligands (Akitsu \& Einaga, 2004, 2005). The dihedral angle between the coordination plane $\left[\mathrm{Cu} 1 / \mathrm{N} 1 / \mathrm{N} 2 / \mathrm{N} 1^{i} / \mathrm{N} 2^{\mathrm{i}}\right.$, symmetry code: (i) $-x,-y,-z]$ and the succinimidate five-membered ring ( $\mathrm{N} 1 / \mathrm{C} 1-\mathrm{C} 4$ ) is $80.2(2)^{\circ}$, and that between the coordination plane and the pyridine ring (N2/C5-C9) is $81.9(2)^{\circ}$. The dihedral angle between the succinimidate and pyridine rings is $85.0(2)^{\circ}$.

As seen from Fig. 1, there is a water molecule of crystallization (together with an inversion-related one) near the Cu complex to form the $\mathrm{O} 1 \cdots \mathrm{H} 3 E-\mathrm{O} 3-\mathrm{H} 3 F \cdots \mathrm{O} 2^{\mathrm{i}}$ hydrogenbonding linkage (Table 2). There are also $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ intermolecular hydrogen bonds involving the amino groups.

## Experimental

Treatment of copper(II) acetate ( $0.226 \mathrm{~g}, 1.25 \mathrm{mmol}$ ), succinimide ( $0.495 \mathrm{~g}, 5.00 \mathrm{mmol}$ ), and 4 -aminopyridine ( $0.235 \mathrm{~g}, 2.50 \mathrm{mmol}$ ) in ethanol ( 50 ml ) at 318 K for 2 h gave rise to a deep blue solution. Brown microcrystals (anhydrous) were obtained from the resulting
solution. Yield $0.0752 \mathrm{~g}(13.2 \%)$. IR ( KBr ): $1618 \mathrm{~cm}^{-1}$ (amide I). UV (reflectance spectra): $16700 \mathrm{~cm}^{-1}\left[s h, F\left(R_{d}\right)=1.44\right], 21000 \mathrm{~cm}^{-1}$ [ $\left.F\left(R_{d}\right)=2.36\right]$. Anal. Found: C 44.42, H $5.12, \mathrm{~N} 17.21 \%$; calcd. for $\mathrm{C}_{18} \mathrm{H}_{24} \mathrm{~N}_{6} \mathrm{CuO}_{6}$ : C 44.67 , H 5.00 , N $17.36 \%$. m.p. 559 K (decomposition). Brown crystals of (I) suitable for X-ray analysis were obtained from a methanol solution over a period of several days. The water solvent molecules came from undried methanol.
