**Key indicators**Single-crystal X-ray study  
 $T = 295$  K  
Mean  $\sigma(\text{C}-\text{C}) = 0.004$  Å  
 $R$  factor = 0.039  
 $wR$  factor = 0.097  
Data-to-parameter ratio = 9.3For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

The title molecule,  $\text{C}_{24}\text{H}_{22}\text{O}_2$ , contains two planar naphthyl ring systems. The torsion angle around the the central C—C bond is  $111.3(2)^\circ$  implying a *transoid* conformation with respect to the two ethoxy substituents. Only weak intermolecular interactions are present in the crystal structure.

**Comment**

The structure of (*S*)-2,2'-diethoxy-1,1'-binaphthyl, (I), was determined as part of a study of several binaphthalene derivatives as possible candidates for second-order non-linear optics (Deussen, Hendricks *et al.*, 1996; Deussen *et al.*, 1998), as well as chiral dopants for nematic liquid crystals (Deussen, Shibaev *et al.*, 1996; Shibaev *et al.* 1997). The molecules studied for second-order non-linear optics had electron-acceptor groups at their 6,6'-positions to increase polarizability. The title compound is thus not expected to exhibit second-order optical properties although the crystal structure requirement of non-centrosymmetry is fulfilled.

The molecular structure is depicted in Fig. 1. The absolute configuration is known to be *S*, but the chirality could not be determined based on the diffraction data (Friedel pairs were merged). As expected, each of the two naphthyl ring systems is planar. The molecule is twisted around the central C1—C13 bond with a torsion angle C2—C1—C13—C14 of  $111.3(2)^\circ$ . This conformation prevents close interactions between ring systems in neighboring molecules. There are no remarkable short intermolecular distances in the structure. Thus, the intermolecular attractions appear to be rather weak, which is in accordance with the observed low melting point (*ca* 412 K).

**Experimental**

(*S*)-2,2'-Diethoxy-1,1'-binaphthyl was prepared as previously reported (Deussen, Hendricks *et al.*, 1996). Crystals for X-ray analysis were obtained by crystallization from a solution in ligroin.
