Key indicators

Single-crystal X-ray study
 $T = 120$ K
Mean $\sigma(\text{C}-\text{C}) = 0.002$ Å
 R factor = 0.024
 wR factor = 0.060
Data-to-parameter ratio = 17.8

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

2-Bromo-1-chlorophenyl-3-(4-methoxyphenyl)prop-2-en-1-one

The geometrical parameters for the title compound, $\text{C}_{16}\text{H}_{12}\text{BrClO}_2$, are normal. The observed bond lengths and angles imply that there is little electronic conjugation between the two benzene ring systems. An intramolecular $\text{C}-\text{H}\cdots\text{Br}$ interaction may help to establish the molecular conformation. The crystal packing results in a centrosymmetric structure.

Comment

Many chalcone ($\text{C}_{15}\text{H}_{12}\text{O}$) derivatives crystallize as non-centrosymmetric structures and display significant non-linear optical (NLO) properties (Uchida *et al.*, 1998). The title compound, (I), (Fig. 1), was prepared as part of our ongoing studies in this area (Harrison *et al.*, 2005). However, (I) crystallizes in a centrosymmetric space group, thus it has a zero NLO response (Watson *et al.*, 1993).

The geometrical parameters for (I) are normal (Allen *et al.*, 1987) and consistent with those of other chalcone derivatives (Moorthi *et al.*, 2005; Patil *et al.*, 2006). The molecule of (I) is distinctly twisted about the $\text{C}4-\text{C}7$ and $\text{C}7-\text{C}8$ bonds (Table 1). This twisting, and the $\text{C}4-\text{C}7$ and $\text{C}7-\text{C}8$ bond lengths of greater than 1.48 Å, imply that there is limited electronic conjugation between the two aromatic ring systems. The dihedral angle between the benzene ring mean planes ($\text{C}1-\text{C}6$ and $\text{C}10-\text{C}15$) is $53.35(6)^\circ$. $\text{C}7$ and $\text{O}2$ deviate from the former mean plane by 0.176 (3) and 0.895 (3) Å, respectively. By contrast, the terminal methyl atom $\text{C}16$ is almost coplanar with the $\text{C}10-\text{C}15$ ring [deviation = 0.045 (4) Å].

A *PLATON* (Spek, 2003) analysis of (I) indicated a possible intramolecular $\text{C}-\text{H}\cdots\text{Br}$ interaction (Table 2) that might help to maintain near coplanarity between the $\text{C}8/\text{C}9/\text{Br}1$ fragment and the $\text{C}10$ -benzene ring. The predicted (Bondi, 1964) van der Waals contact distance for H and Br is 3.05 Å. There are no $\pi\cdots\pi$ stacking interactions in the crystal structure of (I).

Experimental

2,3-Dibromo-1-chlorophenyl-3-(4-methoxyphenyl)-2-propan-1-one (4.32 g, 0.01 mol) was mixed with triethylamine (5 ml, 0.05 mol) in toluene (100 ml). The reaction was stirred for 24 hrs. and the precipitated triethylamine hydrobromide was removed by filtration.

The solvent was removed under reduced pressure and the resulting solid mass obtained on cooling was collected by filtration. The crude product was recrystallized from ethanol to yield blocks of (I) in 60% yield. M.p.: 403 K. Analysis for $C_{16}H_{12}BrClO_2$: calc. C 54.65, H 3.44%, found: C 54.53, H 3.64%.

Crystal data

$C_{16}H_{12}BrClO_2$	$D_x = 1.650 \text{ Mg m}^{-3}$
$M_r = 351.62$	Mo $K\alpha$ radiation
Monoclinic, $P2_1/c$	Cell parameters from 3426 reflections
$a = 13.9793 (3) \text{ \AA}$	$\theta = 2.9\text{--}27.5^\circ$
$b = 8.8780 (1) \text{ \AA}$	$\mu = 3.09 \text{ mm}^{-1}$
$c = 11.4870 (3) \text{ \AA}$	$T = 120 (2) \text{ K}$
