 μ -Oxalato-bis[(2,2'-bipyridine)(*N,N*-dimethyl-
formamide)copper(II)] bis(perchlorate)

In the title compound, $[\text{Cu}_2(\text{C}_2\text{O}_4)(\text{C}_{10}\text{H}_8\text{N}_2)_2(\text{C}_3\text{H}_7\text{NO})_2](\text{ClO}_4)_2$, the oxalate-bridged binuclear copper(II) complex cation is centrosymmetric. The Cu^{II} atom has a distorted square-pyramidal geometry with two O and two N atoms from oxalate and bipyridine ligands in the basal plane, and with a dimethylformamide O atom in the apical position. The $\text{Cu} \cdots \text{Cu}$ distance is 5.1492 (18) Å.

Received 13 April 2006

Key indicators

Single-crystal X-ray study
 $T = 293 \text{ K}$
 Mean $\sigma(\text{C}-\text{C}) = 0.005 \text{ \AA}$
 R factor = 0.037
 wR factor = 0.093
 Data-to-parameter ratio = 12.9

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

Comment

In the last few decades, the chemistry of bis(bidentate) oxalate complexes has become an active area of research, with interest arising from the various structural features of these compounds (Román *et al.*, 1996; Girerd *et al.*, 1980; Pellaux *et al.*, 1997; Coronado *et al.*, 1996) and their applications in areas such as biological chemistry (Cleare, 1974), catalysis (Sinha & Shankar, 1993; Díaz-Guemes *et al.*, 1987), photochemistry (Hauser *et al.*, 1996) and magnetochemistry (Larionova *et al.*, 1998; Decurtins *et al.*, 1996; Kahn, 1993). In the process of fabricating these kinds of complexes, some organic N-donors, such as 2,2'-bipyridine and related species (Hagrman *et al.*, 1999; Fu *et al.*, 2001), have often been chosen as rigid ligands to bind the metal centres. In particular, binuclear Cu^{II} complexes with bis(bidentate) bridging ligands have been investigated, both experimentally and theoretically (Kahn, 1985; Charlot *et al.*, 1984; Julve *et al.*, 1984). However, there is only one paper to date describing a compound with *N,N*-dimethylformamide (DMF) coordinating to the Cu centre (Foxon *et al.*, 2004), among the many crystal structures of oxalate-bridged binuclear complexes. Here, we report the structure of the title compound, (I).

Compound (I) consists of a $[\text{Cu}_2(\text{ox})(\text{bpy})_2(\text{DMF})_2]^{2+}$ (bpy is 2,2'-bipyridine and ox is oxalate) cation and two perchlorate anions (Fig. 1). The binuclear complex cation has an inversion

Figure 1
The molecular structure of (I), with 50% probability displacement ellipsoids. Dashed lines indicate weak bonds. [Symmetry code: (i) $2 - x, -y, -z$.]

Figure 2
The one-dimensional structure of (I) extending along the a axis, with the complexes bridged by perchlorate anions *via* weak bond interactions and non-classical hydrogen bonds. Dashed lines indicate weak interactions. [Symmetry codes: (i) $2 - x, -y, -z$; (ii) $x - 1, y, z$.]

centre at the midpoint of the $C11-C11^i$ [symmetry code: (i) $2 - x, -y, -z$] bond of the ox ligand. The $Cu1 \cdots Cu1^i$ distance is 5.1492 (18) Å, which compares well with similar types of reported binuclear oxalate-bridged complexes (Kahn, 1985; Charlot *et al.*, 1984; Julve *et al.*, 1984). The coordination geometry of the Cu atom is square-pyramidal, with atoms $O1/O2^i/N1/N2$ from the ox and bpy ligands in the basal plane and atom $O3$ from DMF in the apical position. The Cu atom is displaced 0.0988 (11) Å from the basal plane towards atom $O3$. The in-plane Cu–O bond distances average 1.974 (2) Å and the Cu–N bond distances average 1.980 (3) Å, while the apical Cu–O3 bond distance is 2.335 (2) Å (Table 1). A longer Cu–O distance of 2.653 (3) Å between atom $Cu1$ and perchlorate atom $O11$ *trans* to $O3$ implies a weak bonding interaction.

The perchlorate anions play an important role in the crystal structure of (I). As well as the weak bonding interactions with Cu atoms mentioned above, they are involved in non-classical hydrogen bonds (Table 2) with neighbouring bpy ligands, and thus they bridge the complexes into one-dimensional chains

extending along the a axis (Fig. 2). There is offset π – π stacking between the two bpy ligands related by an inversion centre, the nearest separation being 3.485 (5) Å for $C3 \cdots C3(1 - x, -y, 1 - z)$. These stacking and dipole attractions between the DMF ligands dominate the interchain interactions.

Experimental

All chemicals and solvents used for the synthesis were of reagent grade. A methanol solution (5 ml) of $Cu(ClO_4)_2 \cdot 6H_2O$ (0.0742 g, 0.2 mmol) was added to a stirred aqueous solution (10 ml) of $K_2C_2O_4 \cdot H_2O$ (0.184 g, 1 mmol). The mixture was heated at 333 K for 1 h. Then, a methanol solution (5 ml) of bpy (0.0312 g, 0.2 mmol) and DMF (5 ml) were added to the above mixture in turn. The resulting solution was heated at 333 K for 4 h. The precipitate was filtered off, washed with cold water, methanol and diethyl ether in turn, and then redissolved in water. Blue crystals of (I) were obtained from the solution by slow evaporation (yield 0.0174 g, 60%).
