## \{2-[1-(N-Benzyl-N-methylamino)ethyl]ferrocenyl$\left.\kappa^{2} N, C^{1}\right\}$ chloro(triphenylphosphine- $\kappa P$ ) palladium(II)

The title compound, $\left[\mathrm{FePd}\left(\mathrm{C}_{5} \mathrm{H}_{5}\right)\left(\mathrm{C}_{15} \mathrm{H}_{17} \mathrm{~N}\right) \mathrm{Cl}\left(\mathrm{C}_{18} \mathrm{H}_{15} \mathrm{P}\right)\right]$, a new cyclopalladated complex, has been synthesized and structurally characterized. The $\mathrm{Pd}^{\mathrm{II}}$ atom is in a slightly distorted square-planar environment. The dihedral angle between the cyclopentadienyl rings of the ferrocenyl group is $0.7(2)^{\circ}$.

## Comment

Cycloplatination reactions have attracted much attention in recent decades due to their applications in organic syntheses (Fossy \& Richards, 1999). However, only a few examples of cyclopalladated complexes with N -donor ligands have been reported (Ryabov et al., 2002). As part of our ongoing investigation of the cyclometallation of tertiary ferrocenylamines (Wang et al., 2006), the title compound, (I), has been synthesized and we report its crystal structure.

(I)

In compound (I), the Pd atom is in a slightly distorted square-planar environment. The coordination plane is defined by the atoms $\mathrm{Pd} 1 / \mathrm{N} 1 / \mathrm{Cl} 1 / \mathrm{C} 1 / \mathrm{P} 3$, and the deviations of these atoms from this plane are -0.077 (2), 0.121 (1), $-0.070(2)$, -0.085 (1) and 0.111 (2) $\AA$, respectively. The dihedral angle between the cyclopentadienyl rings of the ferrocenyl group is 0.7 (2) ${ }^{\circ}$.

## Experimental

A solution of sodium tetrachloropalladate(II) ( $150 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) in methanol ( 15 ml ) was added dropwise to a stirred solution of $\{1-[(N-$ methyl- $N$-benzyl)amino]ethylfferrocene ( $167 \mathrm{mg}, \quad 0.5 \mathrm{mmol}$ ) and sodium acetate ( $41 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) in methanol ( 20 ml ). The mixture was stirred at room temperature for 4 h . Triphenylphosphine ( $220 \mathrm{mg}, 0.8 \mathrm{mmol}$ ) was then added and the mixture was stirred for another 30 min . The solvent was removed in vacuo and the solid residue was recrystallized from anhydrous ethanol to obtain compound (I) (yield $63 \%$ ). Crystals of (I) were grown by slow evaporation of an ethyl acetate-petroleum ether solution (3:1) at room temperature over a period of one week. Analysis, calculated for $\mathrm{C}_{38} \mathrm{H}_{37} \mathrm{ClFeNPPd}$ : C 61.98 , H 5.06, N $1.90 \%$; found: C 61.77, H 5.00, N $1.89 \%$.

All H atoms were initially located in difference Fourier maps. The methyl H atoms were then constrained to an ideal geometry, with C H distances of $0.96 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{C})$, but each group was allowed to rotate freely about its $\mathrm{C}-\mathrm{C}$ bond. The other H atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms, with $\mathrm{C}-\mathrm{H}$ distances in the range $0.93-0.98 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$. There are solvent-accessible voids of $53 \AA^{3}$ in the structure. However, the highest peak of the residual density is located $1.32 \AA$ from the Pd atom.

Data collection: SMART (Bruker, 2003); cell refinement: SAINT (Bruker, 2003); data reduction: SAINT; program(s) used to solve
