The title complex,  $[\text{Hg}_2\text{Br}_4(\text{C}_7\text{H}_{16}\text{S}_2)]_n$ , has a chain structure. Two bridging Br atoms and two terminal Br atoms coordinate to two  $\text{Hg}^{\text{II}}$  atoms, forming an  $(\text{HgBr}_2)_2$  dimer, which is located on an inversion center. The 1,3-bis(ethylsulfanyl)propane ligands, which lie on a twofold axis, bridge the  $(\text{HgBr}_2)_2$  dimers, forming a one-dimensional chain. The  $\text{Hg}^{\text{II}}$  atom adopts a tetrahedral geometry, formed by three Br and one S atoms.

Recently, we and others have reported the crystal structures of some  $\text{Hg}^{\text{II}}$  complexes with flexible dithioether ligands, *viz.* 1,4-bis(ethylsulfanyl)butane (Liu *et al.*, 2005), 1,4-bis(benzylsulfanyl)butane (Che *et al.*, 2005) and 1,2-bis(phenylsulfanyl)ethane (Gong *et al.*, 2006). As a result of differences in the terminal groups and/or spacer lengths of ligands, these complexes display different structural features. In continuation of our work, we report here another one-dimensional chain dithioether- $\text{Hg}^{\text{II}}$  complex,  $[(\text{HgBr}_2)_2L]_n$  ( $L$  is 1,3-bis(ethylsulfanyl)propane), (I).

As shown in Fig. 1, the title complex, (I), has a one-dimensional chain structure formed by  $L$  ligands linking  $(\text{HgBr}_2)_2$  dimers. Ligand  $L$  is in the normal  $\mu$ - $S,S'$  bridging coordination mode, and dimeric  $(\text{HgBr}_2)_2$  is formed by two Br anions bridging two  $\text{Hg}^{\text{II}}$  cations and two terminal Br anions, as observed in the structure of  $[\text{Hg}_2\text{Br}_4(1,4\text{-bis(benzylsulfanyl)butane})]_n$  (Che *et al.*, 2005). The distances between  $\text{Hg}^{\text{II}}$  atoms within the dimer and across one  $L$  are 3.874 (2) and 6.359 (2)  $\text{\AA}$ , respectively. The dimer is located on an inversion center, but the ligand  $L$  lies on a twofold axis. The  $\text{Hg}^{\text{II}}$  ion is coordinated by three Br atoms and one S atom from the  $L$  ligand in a distorted tetrahedral geometry, with the bond angles around Hg1 ranging from 91.67 (2) to 127.64 (5) $^\circ$  (Table 1). Compared to (I), the  $\text{Hg}^{\text{II}}$ -1,4-bis(ethylsulfanyl)butane complex (Liu *et al.*, 2005) has a dinuclear structure with different structural parameters. This can be attributed to the difference in the spacer lengths of the two dithioether ligands.

Experimental

1,3-Bis(ethylsulfanyl)propane (*L*) was synthesized according to the literature method of Hartley *et al.* (1979). An acetone solution (10 ml) of HgBr<sub>2</sub> (36 mg, 0.1 mmol) was mixed with a chloroform solution (10 ml) of *L* (33 mg, 0.2 mmol). The mixture was stirred and then filtered. The filtrate was allowed to evaporate slowly at room temperature. After one week, colorless single crystals of (I) suitable for X-ray investigation were collected (yield 50%).
