# 2,2',3,4,4',5,5'-Heptachlorobiphenyl (PCB 180)

In the title compound,  $C_{12}H_3Cl_7$ , there are two molecules in the asymmetric unit. The dihedral angles between the benzene rings are 69.63 (7) and 68.48 (6)°.

Received 18 May 2006 Accepted 11 June 2006

## Comment

As part of our ongoing research on the toxicity of polychlorinated biphenyls (PCBs) (Robertson & Hansen, 2001), we have synthesized 2,2',3,4',5,5'-heptachlorobiphenyl, (I), using the Cadogan coupling reaction. Crystallographic analysis of (I) reveals that there are two molecules in the asymmetric unit (Fig. 1). The dihedral angles, important determinants of the toxicity of PCBs, are 69.63 (7) and 68.48 (6)°. These dihedral angles are smaller than the calculated dihedral angle of 73.0° in aqueous solution.

According to our review of the literature, the experimental dihedral angles for mono-, di-, tri- and tetra-*ortho*-Cl-substi-

labelling scheme. Displacement ellipsoids are drawn at the 50%

probability level. H atoms have been omitted for clarity.

tuted PCB derivatives are  $47-51^{\circ}$  (Kania-Korwel *et al.*, 2004; Lehmler *et al.*, 2001; McKinney & Singh, 1988; van der Sluis *et al.*, 1990), 59–75° (Miao *et al.*, 1997; Rissanen *et al.*, 1988*a*; Rømming *et al.*, 1974; Singh *et al.*, 1986), 82–83° (Lehmler *et al.*, 2005; Rissanen *et al.*, 1988*b*) and 84–87° (Pedersen, 1975; Shaikh *et al.*, 2006; Singh & McKinney, 1979), respectively. As with the title compound, (I), the calculated dihedral angles are typically larger than the solid-state dihedral angles (*viz.* 57.7, 73.0, 89.8 and 89.9° for mono-, di-, tri- and tetra-*ortho*-Cl-substituted PCB derivatives, respectively). The difference between solid-state and calculated solution dihedral angles is probably due to crystal packing effects.

# Experimental

The title compound, (I), was synthesized in 6.5% yield by the Cadogan coupling of 2,4,5-trichloroaniline with an excess of 1,2,3,4-tetrachlorobenzene (Espandiari *et al.*, 2003). The product was purified twice by column chromatography on silica gel using *n*-hexanes as eluent. Colorless plates were obtained upon crystallization from methanol.
