## Bis(2,3-dimethylanilinium) diaquabis-[dihydrogendiphosphato(2-)]cobaltate(II)

In the title compound, $\left(\mathrm{C}_{8} \mathrm{H}_{12} \mathrm{~N}\right)_{2}\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{P}_{2} \mathrm{O}_{7}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]$, the Co atom is located on an inversion center and is surrounded by two dihydrogendiphosphate ligands and two water molecules in an octahedral coordination. The packing is organized in layers containing the cobaltate anions with organic cations arranged in the interlayer spaces and connected through hydrogen bonds to the anions.

## Comment

Hybrid materials with organic and inorganic components are an attractive field of research due to their potential applications in catalysis, ion exchange, etc. (Cheetham et al., 1999; Clearfield, 1998). Incorporation of transition elements into the organic-phosphate framework is particularly interesting, not only because of their fascinating structural features, but also due to the possibility of observing interesting magnetic properties. In recent years, a limited number of transition metal-organic diphosphates has been synthesized (Gharbi et al., 1994; Gharbi \& Jouini, 2004; Essehli et al., 2006).

(I)

The title compound, (I), was prepared as part of our ongoing structural studies on $M^{\mathrm{II}}$-organic diphosphate systems. It is built up from a diaquabis[dihydrogen-diphosphato(2-)]cobaltate(II) anion and two organic 2,3dimethylanilinium cations (Fig. 1). The Co atom is located on an inversion center and is surrounded by two symmetryrelated dihydrogendiphosphate anions and two water molecules to give a slightly distorted $\mathrm{CoO}_{6}$ octahedron. The diphosphate group acts as a bidentate ligand to the central $\mathrm{Co}^{\mathrm{II}}$ atom, thus producing a bent $\mathrm{P}_{2} \mathrm{O}_{7}$ group, with a $\mathrm{P} 1-\mathrm{O} 4-$ P2 angle of $129.05(6)^{\circ}$. Four external O atoms, $\mathrm{O}_{\mathrm{E}}$, of the diphosphate anions build an almost regular square around the cobalt, with $\mathrm{Co}-\mathrm{O}_{\mathrm{E}}$ distances ranging from 2.0524 (15) to 2.0710 (12) $\AA$. The two water molecules are in the axial positions, with a Co-OW distance of 2.1506 (18) $\AA$, significantly longer than the $\mathrm{Co}-\mathrm{O}_{\mathrm{E}}$ contacts. A similar coordination geometry around the central atom has also been observed

Figure 1
A view of the complex anion and one organic cation with the atomlabelling scheme. Displacement ellipsoids are drawn at the $50 \%$ probability level. H atoms are represented as spheres of arbitrary radii. Hydrogen bonds are drawn as dashed lines. [Symmetry code: (i) $1-x$, $1-y, 1-z$.]

Figure 2
A projection of the structure along the [100] direction. Hydrogen bonds are shown as dashed lines.
in other $M^{\mathrm{II}} \mathrm{O}_{6}$ octahedra, $M^{\mathrm{II}}=\mathrm{Co}$ or Ni , in organic diphosphate compounds (Essehli et al., 2006; Gharbi et al., 1994; Gharbi \& Jouini, 2004).

The packing consists of layers built up from the monomeric complex connected via hydrogen bonds and stacked perpendicular to the $c$ axis. The protonated organic 2,3-dimethylanilinium cations occupy the interlayer spaces and interact with the anionic framework through $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, as shown in the projection of the structure along the $a$ axis direction (Fig. 2 and Table 1).

The main geometric features of the hydrogen bonds (Table 1) shows two kinds of hydrogen bonds: (i) $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ contacts, with $\mathrm{O} \cdots \mathrm{O}$ distances ranging from 2.521 (2) to 3.028 (2) $\AA$, link the complex anions, giving rise to a twodimensional anionic framework with the formula $\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{P}_{2} \mathrm{O}_{7}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]^{2 n-}$, as shown in Fig. 3, and (ii) $\mathrm{N}-$ $\mathrm{H} \cdots \mathrm{O}$ contacts, involving weak contacts since the $\mathrm{N} \cdots \mathrm{O}$

Figure 3
A projection of the $\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{P}_{2} \mathrm{O}_{7}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]^{2 n-}$ anionic framework along the $c$ axis
distances are longer, ranging from 2.776 (2) to 2.971 (2) $\AA$, assuring the cohesion of the network.

## Experimental

Crystals of the title compound were prepared by adding an ethanol solution $(10 \mathrm{ml})$ of 2,3-dimethylaniline $(7.52 \mathrm{mmol}$, density $=0.9930)$ dropwise to a mixture of $\mathrm{H}_{4} \mathrm{P}_{2} \mathrm{O}_{7}(3.75 \mathrm{mmol})$ and $\mathrm{CoCl}_{2}(1.88 \mathrm{mmol})$ in a 4:2:1 molar ratio in aqueous solution $(20 \mathrm{ml})$. Good quality pink prisms were obtained after a few days at ambient temperature. The diphosphoric acid, $\mathrm{H}_{4} \mathrm{P}_{2} \mathrm{O}_{7}$, was produced from $\mathrm{Na}_{4} \mathrm{P}_{2} \mathrm{O}_{7}$ by using an ion-exchange resin (Amberlite IR 120).
