#### Key indicators

Single-crystal X-ray study  
T = 296 K  
Mean  $\sigma(\text{C}-\text{C}) = 0.002 \text{ \AA}$   
R factor = 0.049  
wR factor = 0.168  
Data-to-parameter ratio = 15.5

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

## Diethyl pyridine-2,6-dicarboxylate

In the crystal structure of the title compound,  $\text{C}_{11}\text{H}_{13}\text{NO}_4$ , the asymmetric unit contains only one half-molecule; the molecule lies on a twofold rotation axis. The crystal structure is stabilized by intermolecular  $\text{C}-\text{H}\cdots\text{O}$  and  $\text{C}-\text{H}\cdots\text{N}$  hydrogen bonds, linking the molecules along the *b* axis.

Received 21 June 2006

#### Comment

The title compound is an effective material for preparing diacetylpyridine-hydrazine condensed macrocycle complexes (Yang *et al.*, 2002). We report here the crystal structure of the title compound, (I).

In the crystal structure of the title compound, (I) (Fig. 1), the asymmetric unit contains only one half-molecule. A twofold rotation axis passes through atoms N, C6 and H6A. The bond lengths and angles are within normal ranges (Allen *et al.*, 1987).

The central ring A (N/C4-C6/C4A/C5A) is, of course, planar and the O1/O2/C1-C4 group is nearly planar, with a puckering amplitude of  $Q_T = 0.0861(3) \text{ \AA}$  (Cremer & Pople, 1975). The dihedral angle between these planes is  $7.11(3)^\circ$ .

As can be seen from the packing diagram (Fig. 2), intermolecular  $\text{C}-\text{H}\cdots\text{O}$  and  $\text{C}-\text{H}\cdots\text{N}$  hydrogen bonds (Table 1) link the molecules along the *b* axis. Dipole-dipole and van der

Waals interactions are also effective in the molecular packing in the crystal structure.

### Experimental

Pyridine-2,6-dicarbonylchloride (36.5 g) was placed in a three-necked flask fitted with a reflux condenser and absolute ethyl alcohol (300 cc) was added in small portions through the dropping funnel. The alcoholic solution was refluxed for 1 h and the excess alcohol was removed by distillation. The residue was cooled in an ice-bath, covered with a layer of diethyl ether, and a sufficient solution of sodium carbonate (20%) was added to make the aqueous layer alkaline. This layer was then separated and extracted twice with small portions of diethyl ether. The diethyl ether was removed from the combined extracts by distillation. Further distillation of the residue gave the title compound, which was crystallized from diethyl ether (yield 36.0 g, 90%; m.p. 315–316 K).

#### Crystal data
