The title compound, $\text{C}_{21}\text{H}_{19}\text{N}_3\text{O}_6\text{S}$, crystallizes with two molecules in the asymmetric unit. The conformations of these non-planar molecules are similar. Intermolecular $\text{N}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds help to consolidate the crystal structure.

Received 5 September 2006
Accepted 14 September 2006**Comment**

There has been a steady growth of interest in the synthesis, structure and reactivity of Schiff bases due to their potential uses as antibacterial and antitumor agents (Klayman *et al.*, 1979). Among the large number of these compounds, 1-(4-nitrophenyl)hydrazine forms a variety of Schiff bases with aldehydes, and the synthesis and crystal structures of some of them, such as (*E*)-1-(4-methoxy-3-propoxybenzylidene)-2-(4-nitrophenyl)hydrazine (Shi, 2005) and (*E*)-1-[4-(benzyloxy)-benzylidene]-2-(4-nitrophenyl)hydrazine (Jun, 2005) have been reported. In the present study, we report the synthesis and crystal structure of the nitrophenylhydrazine Schiff base derivative (I) (Fig. 1).

The asymmetric unit of (I) consists of two independent molecules, which are quite similar to each other. All the bond lengths and angles in (I) are within their normal ranges (Allen *et al.*, 1987). In molecule 1, the vanillin group (atoms C7–C13/O3/O4) is planar, with an r.m.s. deviation, δ , from the mean plane of 0.0319 Å. It makes dihedral angles of 10.71 (3) and 57.10 (15)° with the nitrophenylhydrazine residue (C1–C6/N1–N3/O1/O2) and the terminal benzene ring (C15–C20), respectively. In molecule 2, the vanillin group (atoms C28–C33/O9/O10) is also planar, with $\delta = 0.0328$ Å, and it makes dihedral angles of 6.08 (2) and 57.01 (14)° with the nitrophenylhydrazine residue (C24–C29/N4/N5) and the terminal benzene ring (C36–C41), respectively. In addition, the vanillin groups of molecules 1 and 2 are close to coplanar, making a dihedral angle of 7.26 (3)°, while the dihedral angle between the nitrophenylhydrazine residues is 9.84 (2)°.

Two intermolecular $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds and two weak non-classical intermolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds

are found in (I) (Table 1 and Fig. 2), which help to consolidate the crystal structure. These hydrogen bonds link adjacent molecules, forming an infinite network.

Experimental

An anhydrous ethanol solution (50 ml) of 4-formyl-2-methoxyphenyl 4-methylbenzenesulfonate (3.06 g, 10 mmol) was added to an anhydrous ethanol solution (50 ml) of 1-(4-nitrophenyl)hydrazine (1.53 g, 10 mmol) and the mixture stirred at 350 K for 5 h under nitrogen. A yellow precipitate appeared which was isolated, recrystallized from ethanol and then dried in a vacuum to give the pure compound in 83% yield. Yellow single crystals of (I) suitable for X-ray analysis were obtained by slow evaporation of an ethanol solution.
