pentane-1,5-dioneIn the title compound, $\text{C}_{19}\text{H}_{13}\text{Br}_2\text{NO}_4\text{S}_2$, the two bromothieryl rings have different orientations with respect to the carbonyl groups. The nitro group is almost coplanar with the benzene ring to which it is attached.Received 21 August 2006

Comment

Today, crystals play an important role in electronic and photonic industries, such as in the production of high-efficiency photovoltaic cells, fabrication of bright and long-lasting light emitting diodes (LEDs) and in liquid crystal displays (LCDs). Crystal growth is a multidisciplinary field, which demands collaboration of chemical and process engineers, electrical and mechanical engineers, instrumentation engineers, materials scientists, numerical simulation specialists, physicists and crystallographers (Tareen & Kutty, 2001). The present day demand is for large and high-quality ferroelectric, piezoelectric single crystals with minimum defects and inhomogeneities. The important goal of crystal growth is the improvement of microscopic and macroscopic homogeneity, which is a necessity for any application. The crystal structures of 3-hydroxy-1,3-bis(2-thienyl)prop-2-en-1-one (Baxter *et al.*, 1990) and 1-(4-chlorophenyl)-3-(2-thienyl)prop-2-en-1-one (Ng *et al.*, 2006) have been reported. In continuation of our work on crystal structures of new organic compounds and chalcones (Yathirajan *et al.*, 2006a,b), the title compound has been synthesized and its crystal structure is reported.

The molecular structure of the title compound is shown in Fig. 1. Bond lengths and angles can be regarded as normal (Cambridge Structural Database, Version 5.27, November 2005, updated August 2006; *Mogul*, Version 1.1; Allen, 2002). Whereas one of the carbonyl groups is *trans* to the nearest C—S bond, the other is *cis* configured (Table 1). The nitro group is almost coplanar with the benzene ring to which it is attached.

Experimental

2-Acetyl-3-bromothiophene (20 g, 0.096 mol) in methanol (50 ml) was mixed with 3-nitrobenzaldehyde (7.2 g, 0.048 mol) and the

mixture was treated with 10 ml of a 30% potassium hydroxide solution at 278 K. The reaction mixture was then brought to room temperature and stirred for 4 h. The solid that precipitated was filtered off, washed with water, dried and recrystallized from an acetone/methanol mixture (1:1) (yield 75%, m.p. 439–441 K). Analysis for $C_{19}H_{13}Br_2NO_4S_2$: found (calculated): C 41.91 (42.01), H 2.32 (2.41), N 2.46 (2.58), S 11.72 (11.80)%.
