Key indicators

Single-crystal X-ray study
 $T = 293$ K
 Mean $\sigma(C-C) = 0.007$ Å
 R factor = 0.053
 wR factor = 0.128
 Data-to-parameter ratio = 15.2

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

In the title compound, $[Zn(C_{30}H_{28}BN_6)(C_4H_3N_2O_2)] \cdot CH_3OH$, the zinc ion is coordinated by three N atoms of the tridentate pyrazolyl groups, one of the carboxylate O atoms and one N atom of the 1*H*-imidazole-4-carboxylate ligand in a trigonal-bipyramidal geometry.

Comment

One of the most important model complexes of matrix metalloproteinases is the hydridotris(3,5-methylphenylpyrazolyl)borate zinc hydroxide ($Tp^{Me,Ph}Zn-OH$). This compound exhibits high structural similarity to the catalytic center of the enzymes (Parkin, 2004; Puerta & Cohen, 2003). Structural analysis revealed that the zinc ion in this model compound adopted a tetrahedral geometry with bond distances and bond angles very close to the corresponding parameters in the enzymes. Previously, we (He, 2006*a,b*; He *et al.*, 2005) reported the interactions of this compound with a variety of potential synthetic inhibitors of these enzymes and found that their coordination modes to Zn^{2+} ions were highly dependent upon the bite size of the inhibitor. To further examine the preference of monodentate and bidentate coordination of an inhibitor to the Zn^{2+} ion, we have studied the interaction of $[Tp^{Me,Ph}Zn-OH]$ with 1*H*-imidazole-4-carboxylic acid, which can bind to Zn^{2+} through one imidazole N (monodentate), one imidazole N and one carboxylate O (bidentate), or two carboxylate O (bidentate) atoms.

In the title complex, (I), the tridentate hydridotris(3,5-methylphenylpyrazolyl) ligand is coordinated to the zinc *via* pyrazolyl atoms N1, N3 and N5 (Fig. 1). The 1*H*-imidazole-4-carboxylate anion coordinates to Zn^{2+} through the chelation of carboxylate O2 and imidazolyl N7 atoms. The angular structural parameter, τ , is 1.01 (Addison *et al.* 1984). Thus, zinc adopts a trigonal-bipyramidal geometry. Atoms O2 and N3 occupy the axial positions with an angle of $170.15(12)^\circ$ about

the Zn atom. Atoms N1, N5 and N7 occupy equatorial positions. The other bond lengths and angles are in normal ranges (Puerta & Cohen, 2002, 2003). These results show that the chelation effect in this molecule is much stronger than that of chelation from two O atoms of the carboxylate anion.

Atom O1 is hydrogen bonded to O3 through H3A, whereas O2 is hydrogen-bonded to atom N12 of a second molecule (Table 1).

Experimental

Equimolar quantities of hydridotris(3,5-methylphenylpyrazolyl)-borate zinc hydroxide (69.2 mg, 0.12 mmol) (Puerta & Cohen, 2002) and 1*H*-imidazole-4-carboxylic acid (14.9 mg, 0.12 mmol) were separately dissolved in 10 and 2 ml of methanol, respectively. The solutions were mixed and stirred magnetically for 30 min. The solid formed was collected and dried under vacuum. Yield 48 mg, 69%.

Crystal data

[Zn(C ₃₀ H ₂₈ BN ₆)(C ₄ H ₃ N ₂ O ₂)]·CH ₄ O	$V = 3429.7 (12) \text{ \AA}^3$
$M_r = 691.89$	$Z = 4$
Monoclinic, $P2_1/n$	$D_x = 1.340 \text{ Mg m}^{-3}$
$a = 15.371 (3) \text{ \AA}$	Mo $K\alpha$ radiation
$b = 13.829 (3) \text{ \AA}$	$\mu = 0.76 \text{ mm}^{-1}$
$c = 16.357 (3) \text{ \AA}$	$T = 293 (2) \text{ K}$
$\beta = 99.46 (3)^\circ$	Prism, colorless
	$0.20 \times 0.20 \times 0.10 \text{ mm}$

Data collection

Bruker SMART 1K CCD diffractometer	42524 measured reflections
φ and ω scans	6734 independent reflections
Absorption correction: multi-scan (SADABS; Sheldrick, 2002)	4349 reflections with $I > 2\sigma(I)$
$T_{\min} = 0.862, T_{\max} = 0.928$	$R_{\text{int}} = 0.089$
	$\theta_{\text{max}} = 26.0^\circ$

Refinement

Refinement on F^2	$w = 1/[\sigma^2(F_o^2) + (0.0294P)^2 + 6.1376P]$
$R[F^2 > 2\sigma(F^2)] = 0.053$	where $P = (F_o^2 + 2F_c^2)/3$
$wR(F^2) = 0.128$	$(\Delta/\sigma)_{\text{max}} = 0.001$
$S = 1.10$	$\Delta\rho_{\text{max}} = 0.42 \text{ e \AA}^{-3}$
6734 reflections	$\Delta\rho_{\text{min}} = -0.35 \text{ e \AA}^{-3}$
443 parameters	Extinction correction: SHELXL97
H atoms treated by a mixture of independent and constrained refinement	Extinction coefficient: 0.00088 (15)

Table 1

Hydrogen-bond geometry ($\text{\AA}, ^\circ$).

$D-H\cdots A$	$D-H$	$H\cdots A$	$D\cdots A$	$D-H\cdots A$
O3—H3A \cdots O1	0.82	1.93	2.728 (5)	165
N12—NH12 \cdots O2 ⁱ	0.86	1.89	2.711 (4)	160

Symmetry code: (i) $-x + \frac{3}{2}, y + \frac{1}{2}, -z + \frac{3}{2}$.

The H atoms on B1 was refined [$B1-BH = 1.10 (4) \text{ \AA}$], while the other H atoms were geometrically constrained and refined in riding
