In the title compound, $\text{C}_{23}\text{H}_{22}\text{N}_2\text{O}_6$, the vanillin group makes dihedral angles of $81.15(6)$ and $23.52(7)^\circ$, respectively, with the phenyl ring and the benzohydrazide mean plane. An intramolecular $\text{N}-\text{H}\cdots\text{O}$ hydrogen bond helps to stabilize the molecular conformation, while the water molecule interacts with the organic molecule by way of a bifurcated $\text{O}-\text{H}\cdots(\text{O},\text{N})$ interaction.

Comment

There has been a steady growth of interest in the synthesis, structure, and reactivity of Schiff bases due to their potential applications in areas such as biological modelling, catalysis, and as molecular magnets (Jones *et al.*, 1979; Larson & Pecoraro, 1991). One of the aims of investigating the structural chemistry of Schiff bases is to develop protein and enzyme mimics (Santos *et al.*, 2001). As part of an investigation of the coordination properties of Schiff bases functioning as ligands, we report the synthesis and structure of the title compound, (I).

In (I) (Fig. 1), the vanillin group (atoms C8–C13/C15/O2/O3) is essentially planar, with an r.m.s. deviation for fitted atoms of 0.015 \AA . This plane makes dihedral angles of $23.52(7)$ and $81.15(6)^\circ$, respectively, with the benzohydrazide ring (atoms C17–C22) and the C1–C6 phenyl ring. The dihedral angle between the C1–C6 and C17–C22 mean planes is $59.63(8)^\circ$. All other bond lengths and angles for (I) are within their normal ranges (Allen *et al.*, 1987).

An intramolecular hydrogen bond links the NH group to O5, thereby influencing the molecular conformation. A bifurcated $\text{O}-\text{H}\cdots(\text{N},\text{O})$ intermolecular hydrogen bond links the water molecule to the organic molecule (Table 1). The other water H atom participates in an $\text{O}-\text{H}\cdots\text{O}$ hydrogen bond to an adjacent organic molecule, resulting in dimeric associations of two organic molecules and two water mol-

ecules (Fig. 2). A weak intermolecular C—H···O interaction is also present.

Experimental

An anhydrous ethanol solution (50 ml) of 4-formyl-2-methoxyphenyl benzoate (2.56 g, 10 mmol) was added to an anhydrous ethanol solution (50 ml) of 2-methoxybenzohydrazide (1.66 g, 10 mmol) and the mixture stirred at 350 K for 5 h under nitrogen, giving a pale-yellow precipitate. The product was isolated, recrystallized from acetonitrile and then dried in a vacuum to give the pure compound in 78% yield. Pale-yellow single crystals of (I) suitable for X-ray analysis were obtained by slow evaporation of an acetonitrile solution.
