dinitrate**The asymmetric unit of the title compound, $\text{C}_{10}\text{H}_{26}\text{N}_2\text{O}_2^{2+} \cdot 2\text{NO}_3^-$, comprises one half of an *N*-diprotonated (*R,S*)-ethambutol cation, which lies about a centre of symmetry, and a nitrate anion. In the crystal structure, a two-dimensional network is formed *via* intermolecular $\text{O}-\text{H} \cdots \text{O}$ and $\text{N}-\text{H} \cdots \text{O}$ hydrogen bonds.Received 5 November 2006

Comment

The title compound, (I), is a nitrate salt of (*R,S*)-ethambutol (Bai, Zhang, Zhang *et al.*, 2006). It is derived from the *meso* form of (*S,S*)-ethambutol (Bai, Zhang, Qin *et al.*, 2006), which is a key intermediate for the synthesis of ethambutol hydrochloride, a widely used chiral antitubercular agent (Fadnavis *et al.*, 1999). The cation, protonated on both N atoms, lies about a centre of inversion located at the mid-point of the central C—C bond (Fig. 1). Bond lengths and angles are normal (Allen *et al.*, 1987) and similar to those found in the neutral (*R,S*)-molecule (Bai, Zhang, Zhang *et al.*, 2006) and in the isomeric chiral (*S,S*)-cation (Bai, Ning *et al.*, 2006).In the crystal structure, the two nitrate anions form $\text{N1}-\text{H} \cdots \text{O2}$ hydrogen bonds to the protonated N atoms (Fig. 1). Further stabilization is provided by an extensive network of $\text{N}-\text{H} \cdots \text{O}$ and $\text{O}-\text{H} \cdots \text{O}$ hydrogen bonds (Fig. 2 and Table 1), forming layers parallel to the *ac* plane. The layers are further linked through hydrogen bonding to the nitrate anions.

Experimental

The title compound was prepared by the reaction of nitric acid with (*R,S*)-ethambutol. Colourless single crystals of (I) were grown by slow evaporation of a methanol solution.

H atoms on N and O atoms were located in a difference Fourier map and then refined freely with their displacement parameters tied to $1.2U_{\text{eq}}(\text{N})$ and $1.5U_{\text{eq}}(\text{O})$. Other H atoms were positioned geometrically and refined using a riding model, with $C-H = 0.98 \text{ \AA}$ and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ for CH , $C-H = 0.97 \text{ \AA}$ and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ for CH_2 and $C-H = 0.96 \text{ \AA}$ and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for CH_3 H atoms.
