Received 22 May 2007; accepted 23 May 2007

Key indicators: single-crystal X-ray study;  $T = 299$  K; mean  $\sigma(\text{C}-\text{C}) = 0.005 \text{ \AA}$ ;  $R$  factor = 0.055;  $wR$  factor = 0.161; data-to-parameter ratio = 14.7.

In the structure of the title compound (24DMPMSA),  $\text{C}_9\text{H}_{13}\text{NO}_2\text{S}$ , the conformation of the N–H bond is *syn* to the *ortho*-methyl substituent, similar to the *syn* conformation observed for *N*-(2-methylphenyl)methanesulfonamide (2MPMSA). The geometric parameters in 24DMPMSA are similar to those in *N*-phenylmethanesulfonamide, 2MPMSA and *N*-(2,3-dimethylphenyl)methanesulfonamide, except for some differences in the torsion angles. The amide H atom is readily available to a receptor molecule during its biological activity, as it lies on one side of the plane of the benzene ring, while the methanesulfonyl group is on the opposite side, similar to those in *N*-arylmethanesulfonamides. The molecules in 24DMPMSA are packed into chains through N–H···O hydrogen bonds.

### N-(2,4-Dimethylphenyl)methanesulfonamide

**B. T. Gowda, S. Foro and H. Fuess**

#### Comment

The structural studies of sulphonanilides are of interest due to their biological activity. The latter is thought to be due to the hydrogen of the phenyl N—H portion of the sulphonanilide molecules as it can align itself, in relation to a receptor site. In the present work, the structure of *N*-(2,4-dimethylphenyl)-methanesulfonamde (24DMPMSA) has been determined to explore the substituent effects on the solid state structures of sulfonanilides (Gowda *et al.*, 2007*a-h*). The structure of 24DMPMSA (Fig. 1) resembles those of *N*-(phenyl)-methanesulfonamde (PMSA) (Klug, 1968), *N*-(2-methylphenyl)-methanesulfonamde (2MPMSA) (Gowda *et al.*, 2007*d*), *N*-(2,3-dimethylphenyl)- methanesulfonamde (23DMPMSA)(Gowda *et al.*, 2007*h*) and other alkyl sulfonanilides (Gowda *et al.*, 2007*a-c,e-g*). The conformation of of the N—H bond is *syn* to the *ortho*-methyl substituent, similar to the *syn* conformation observed for the 2MPMSA). The *ortho* substitution of a methyl group in PMSA changes its space group from monoclinic  $P2_1/c$  to triclinic P-1. Substitution of an additional methyl group at the *para* position in 2MPMSA to produce 24DMPMSA, changes the space group from triclinic P-1 to monoclinic  $P2_1/n$ , in contrast to the orthorhombic  $P2_12_12_1$  space group observed for 23DMPMSA. The geometric parameters in 24DMPMSA are similar to those in PMSA, 2MPMSA and 23DMPMSA except for some difference in the torsional angles, C1S2N5C6, S2N5C6C7, S2N5C6C11, O3S2N5C6 and O4S2N5C6:62.2 (2) $^\circ$ , 75.5 (2) $^\circ$ , -106.6 (2) $^\circ$ , -54.4 (2) $^\circ$ , 177.7 (2) $^\circ$  (PMSA); -64.5 (2) $^\circ$ , 117.1 (2) $^\circ$ , -65.3 (3) $^\circ$ , 51.3 (2) $^\circ$ , 179.1 (2) $^\circ$  (2MPMSA); 71.4 (3) $^\circ$ , 70.1 (4) $^\circ$ , -110.8 (3) $^\circ$ , -44.9 (3) $^\circ$ , -172.6 (3) $^\circ$  (23DMPMSA), -62.9 (3) $^\circ$ , -67.8 (4) $^\circ$ , 113.5 (3) $^\circ$ , 53.1 (3) $^\circ$ , -178.4 (3) $^\circ$  (24DMPMSA), respectively. The data included for PMSA are the values determined under the present conditions as the literature values were determined in 1968. The N—H hydrogen is readily available to a receptor molecule during its biological activity as it sits alone on one side of the plane of the phenyl group, while the whole methanesulfonyl group is on the opposite side of the plane similar to those in *N*-(aryl)-methanesulfonamdes. The molecules in 24DMPMSA are packed into chains in the direction of *b* axis (Fig. 2) through N—H···O hydrogen bonds (Fig. 3 and Table 1).

#### Experimental

The title compound was prepared according to the literature method (Jayalakshmi & Gowda, 2004). The purity of the compound was checked by determining its melting point. It was characterized by recording its infrared and NMR spectra (Jayalakshmi & Gowda, 2004). Single crystals of the title compound were obtained from a slow evaporation of its ethanolic solution and used for X-ray diffraction studied at room temperature.

#### Refinement

The H atom of the NH group was located in a differrence map and its position refined. The carbon-bound H atoms were positioned with idealized geometry and refined using a riding model with C—H = 0.93 Å (CH aromatic) or 0.96 Å (CH<sub>3</sub>). Isotropic displacement parameters for all H atoms were set equal to 1.2  $U_{\text{eq}}$  (parent atom).

## Figures

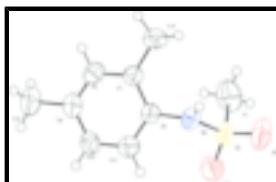

Fig. 1. Molecular structure of the title compound showing the atom labelling scheme. Displacement ellipsoids are drawn at the 50% probability level. H atoms are represented as small spheres of arbitrary radii.

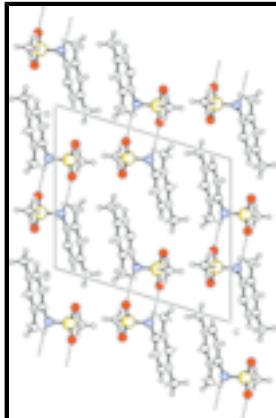

Fig. 2. The crystal packing of the title compound, viewed down the  $b$  axis.

Fig. 3. Hydrogen bonding in the title compound. Hydrogen bonds are shown as dashed lines.

## *N*-(2,4-dimethylphenyl)methanesulfonamide

### Crystal data

$C_9H_{13}NO_2S$	$F_{000} = 424$
$M_r = 199.26$	$D_x = 1.318 \text{ Mg m}^{-3}$
Monoclinic, $P2_1/n$	$\text{Cu } K\alpha \text{ radiation}$
Hall symbol: -P 2yn	$\lambda = 1.54180 \text{ \AA}$
$a = 12.3120 (10) \text{ \AA}$	Cell parameters from 25 reflections
$b = 6.1393 (6) \text{ \AA}$	$\theta = 8.0\text{--}25.2^\circ$
$c = 13.9070 (10) \text{ \AA}$	$\mu = 2.62 \text{ mm}^{-1}$
$\beta = 107.206 (9)^\circ$	$T = 299 (2) \text{ K}$
$V = 1004.15 (15) \text{ \AA}^3$	Prism, colourless
$Z = 4$	$0.28 \times 0.13 \times 0.08 \text{ mm}$

### Data collection

Enraf–Nonius CAD-4 diffractometer	$R_{\text{int}} = 0.129$
Radiation source: fine-focus sealed tube	$\theta_{\text{max}} = 67.0^\circ$
Monochromator: graphite	$\theta_{\text{min}} = 4.2^\circ$
$T = 299(2) \text{ K}$	$h = 0 \rightarrow 14$

$\omega/2\theta$ scans	$k = -7 \rightarrow 0$
Absorption correction: $\psi$ scan (North <i>et al.</i> , 1968)	$l = -16 \rightarrow 15$
$T_{\min} = 0.678$ , $T_{\max} = 0.817$	3 standard reflections
1880 measured reflections	every 120 min
1792 independent reflections	intensity decay: 1.0%
1177 reflections with $I > 2\sigma(I)$	

### Refinement

Refinement on $F^2$	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H atoms treated by a mixture of independent and constrained refinement
$R[F^2 > 2\sigma(F^2)] = 0.055$	$w = 1/[\sigma^2(F_o^2) + (0.0948P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$wR(F^2) = 0.161$	$(\Delta/\sigma)_{\max} = 0.034$
$S = 1.02$	$\Delta\rho_{\max} = 0.26 \text{ e } \text{\AA}^{-3}$
1792 reflections	$\Delta\rho_{\min} = -0.25 \text{ e } \text{\AA}^{-3}$
122 parameters	Extinction correction: SHELXL97 (Sheldrick, 1997), $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0055 (11)
Secondary atom site location: difference Fourier map	

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
