Received 20 November 2009; accepted 15 December 2009

A series of 41 papers by H. Zhong *et al.* are retracted.

As a result of problems with the data sets and incorrect atom assignments, 41 papers by H. Zhong *et al.* are retracted. Full details of all the articles are given in Table 1.

Table 1

Details of articles to be retracted, in order of publication.

Title	Reference	DOI	Refcode
<i>Aquachlorobis(1,10-phenanthroline)cobalt(II) chloride thiourea solvate</i>	Zhong, Zeng, Liu & Luo (2006a)	10.1107/S1600536806041122	KERQEE

Correspondence e-mail: huazhong06@126.com

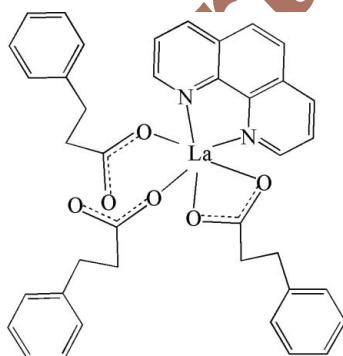

Received 6 June 2007; accepted 12 June 2007

Key indicators: single-crystal X-ray study; $T = 273\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.014\text{ \AA}$; R factor = 0.041; wR factor = 0.171; data-to-parameter ratio = 19.4.

The La^{III} atom in the title complex, $[\text{La}(\text{C}_9\text{H}_9\text{O}_2)_3(\text{C}_{12}\text{H}_8\text{N}_2)]$, is coordinated by two N atoms of a 1,10-phenanthroline (phen) ligand and four O atoms of three phenylpropanoate ligands. This mononuclear complex is further extended into a supramolecular network structure via nonclassical hydrogen bonds between CH groups of 1,10-phenanthroline or phenylpropanoate and O atoms of neighbouring phenylpropanoate ligands.

Comment

In recent years, there has been great interest in the synthesis of metal organic frameworks (MOFs) with organic ligands and rare earth metals because of their novel structures, fascinating properties and important roles in special materials having optical, electronic, magnetic and biological importance potential applications (Deborah *et al.*, 2000; Farrugia *et al.*, 2000; Tsukube & Shinoda, 2002; Zhang *et al.*, 2005). These compounds are usually prepared by the reaction of rare-earth metal ions with bi- or multidentate ligands (Starynowicz, 1991, 1993; Kay *et al.*, 1972; Ma *et al.*, 1999; Zeng *et al.*, 2000; Mao *et al.*, 1998). We report herein the crystal structure of the title compound, (I).

In the molecule of (I) (Fig. 1), the ligand bond lengths and angles are within normal ranges (Allen *et al.*, 1987). The six-coordinate environment of the La atom is completed by The two N atoms of 1,10-phenanthroline ligand and four O atoms of three benzenepropanoic acid ligands (Table 1). The La—O bond lengths are in the range 2.478 (4) to 2.908 (6) Å. The La—N bond lengths are in the range 2.717 (6) to 2.749 (5) Å. C—H···O non-classical hydrogen bonds between C—H groups of 1,10-phenanthroline or benzenepropanoic acid and O atoms of neighbouring benzenepropanoic acid molecules, with an average C···O distances of 3.235 (10) Å, generate a layered hydrogen-bonded network (Fig. 2 and Table 2). The non-classical hydrogen-bonding interactions link the mononuclear complex into a supramolecular network structure.

Experimental

Crystals of the title compound were synthesized using hydrothermal method in a 23 ml Teflon-lined Parr bomb, which was then sealed. Lanthanum (III) chloride hexahydrate (106.1 mg, 0.3 mmol), phen (59.4 mg, 0.3 mmol), benzenepropanoic acid (90.1 mg, 0.6 mmol) and distilled water (3.5 g) were placed into the bomb and sealed. The bomb was then heated under autogenous pressure up to 423 K over the course of 7 d and allowed to cool at room temperature for 24 h. Upon opening the bomb, a clear colourless solution was decanted from small colourless crystals. These crystals were washed with distilled water followed by ethanol, and allowed to air-dry at room temperature.

Refinement

H atoms were positioned geometrically, with C—H = 0.93 – 0.97 Å, and constrained to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

$h = -25 \rightarrow 24$

$T_{\min} = 0.682, T_{\max} = 0.907$

$k = -10 \rightarrow 11$

26367 measured reflections

$l = -26 \rightarrow 26$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.041$	H-atom parameters constrained
$wR(F^2) = 0.171$	$w = 1/[\sigma^2(F_o^2) + (0.1521P)^2 + 0.285P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 0.96$	$(\Delta/\sigma)_{\text{max}} = 0.003$
7231 reflections	$\Delta\rho_{\text{max}} = 1.05 \text{ e \AA}^{-3}$
373 parameters	$\Delta\rho_{\text{min}} = -1.18 \text{ e \AA}^{-3}$
4 restraints	Extinction correction: none
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
