Received 4 May 2007; accepted 25 May 2007

Key indicators: single-crystal X-ray study; $T = 183\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.035; wR factor = 0.087; data-to-parameter ratio = 9.9.

The Schiff base-type title compound, $C_{15}H_{15}N_3O_2$, was obtained by the reaction of 3-(2-pyridyl)propionohydrazide with salicylaldehyde in ethanol. Whereas the ^1H NMR spectrum in solution points to a mixture of two isomers, only one isomer was found in the solid state. The phenolic OH group forms an intramolecular hydrogen bond with the imino N atom. Intermolecular hydrogen bonds between the amido NH function and the pyridyl N atom join the molecules into chains parallel to the a axis. The compound is achiral, but crystallizes in the space group $P2_12_12_1$, with the molecule adopting a chiral conformation.

3-(2-Pyridyl)-N'-salicylidenepropionohydrazide

A. Roth, A. Buchholz, M. Gärtner, H. Görls and W. Plass

Comment

N-Salicylidenehydrazides and their metal complexes show a wide range of biological activities (Johnson *et al.*, 1982; Mohan *et al.*, 1987a; Koh *et al.*, 1998; Mohan *et al.*, 1987b; Ainscough *et al.*, 1999}. Most of the N-salicylidenehydrazide ligands reported so far provide hydrophobic alkylic or arylic side chains. However, in the past few years, new Schiff-base ligands bearing hydroxy and amino functions in the side chains have been synthesized to enable assembly of molecules in the crystal *via* hydrogen-bond interactions (Nica *et al.*, 2005; Pohlmann *et al.*, 2005; Becher *et al.*, 2006; Roth *et al.*, 2007). In this paper we report the crystal structure of the new Schiff-base ligand N-salicylidene-3-(2-pyridyl)-propionic acid hydrazide ($\text{H}_2\text{salhypyp}$).

The compound was obtained by Schiff-base reaction of 3-(2-pyridyl)-propionic acid hydrazide with salicylaldehyde in ethanol. The NMR spectra revealed a splitting of most signals, indicating the presence of two isomers in solution, probably caused by *cis/trans* isomerization of the amide function. According to the ^1H NMR spectra (DMSO, 300 K), the ratio of isomers is 1.8:1. The crystal structure of $\text{H}_2\text{salhypyp}$ revealed only one isomer, with *trans* configuration of the amide group (Fig. 1). The phenolic O–H group forms an intramolecular hydrogen bond to the imino nitrogen atom N1. Intermolecular hydrogen bonds between the amido N–H function and the pyridyl nitrogen N3 join the molecules into chains parallel to the *a* axis. $\text{H}_2\text{salhypyp}$, which is achiral, crystallizes in the orthorhombic space group $P2_12_12_1$, with the molecules adopting a chiral conformation.

Experimental

IR spectra were measured on a Bruker IFS55/Equinox spectrometer. Mass spectra were carried out on a MATSSQ-710 Bruker instrument. Elemental analyses were acquired by use of a LECO CHN/932 elemental analyzer. NMR spectra were recorded on a Bruker Avance 400 MHz spectrometer.

3-(2-Pyridyl)-propionic acid hydrazide was prepared according to described methods, *i.e.* reaction of potassium cyanide with 2-(2-pyridyl)-ethylbromide (Walter *et al.*, 1941), hydrolysis of 3-(2-pyridyl)-propionitrile with hydrochloric acid (Doering *et al.*, 1947), acid catalyzed esterification of 3-(2-pyridyl)-propionic acid in dry ethanol, and hydrazinolysis of the corresponding ethylester (Hallinan *et al.*, 1993).

3-(2-Pyridyl)-propionic acid hydrazide (650 mg, 3.94 mmol) dissolved in 10 ml ethanol was reacted at RT with one equivalent of salicylaldehyde and stirred for 1 h. The title compound (920 mg, 3.43 mmol) was obtained as microcrystalline colourless solid after leaving the reaction solution at 277 K over night. Recrystallization from ethanol (slow evaporation) lead to single crystals suitable for X-ray crystallography. The NMR spectra indicate the existence of two isomers in solution. $\text{C}_{15}\text{H}_{15}\text{N}_3\text{O}_2$ (269.3): calcd. C 66.90, H 5.6, N 15.60, found C 66.95, H 5.59, N 15.92. IR (KBr): 3156 (v(N–H)), 1684 (Amid I and v(C=N)) cm^{-1} . ^1H -NMR (DMSO, 400 MHz): 2.68 (*t*, $^3\text{J}=7.50$ Hz, CH_2 –CO, major isomer); 3.06 (*m*, CH_2 –py, both isomers, and CH_2 –CO, minor isomer); 6.86 (*2H*, *m*, HC_{Ph}); 7.24 (*3H*, *m*, 2 HC_{py} and 1 HC_{Ph}); 7.47 and 7.58 (*1H*, *m*, HC_{Ph});

supplementary materials

MS (EI): m/z = 269 (M^+), 134 (100%, [py-CH₂-CH₂-CO]⁺), 106 ([py-CH₂-CH₂]⁺).

Refinement

H atoms were positioned geometrically, C(sp^2)—H = 0.95 Å, C(methylene)—H = 0.99 Å, O—H = 0.84 Å and N—H = 0.88 Å, and treated as riding atoms with displacement parameters, $U_{\text{iso}}(\text{H}) = xU_{\text{eq}}(\text{C})$, where $x = 1.5$ for O—H and 1.2 for all others. In the absence of significant anomalous scattering effects, Friedel pairs were averaged prior to the final refinement and the absolute structure was not determined.

Figures

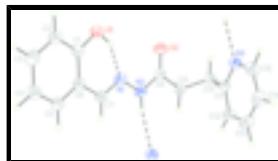

Fig. 1. Molecular structure of H₂salpyph. Displacement ellipsoids are drawn at the 50% probability level. Hydrogen bonds are shown with dashed line.

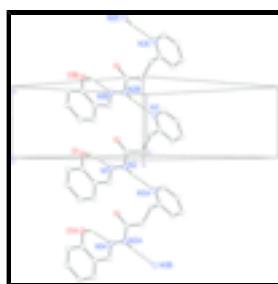

Fig. 2. Chains of H₂salpyph molecules formed *via* N—H···N hydrogen bonding. Hydrogen bonds are shown with dashed lines. Only H atoms from the N—H and O—H groups are shown.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
