Key indicators: single-crystal X-ray study;  $T = 120$  K; mean  $\sigma(C-C) = 0.004$  Å;  $R$  factor = 0.041;  $wR$  factor = 0.101; data-to-parameter ratio = 9.5.

There are two independent molecules of bis(17-oxoandrost-5-en-3 $\beta$ -yl) oxalate, [or bis(DHEA) oxalate],  $C_{40}H_{54}O_6$ , in the asymmetric unit of the title compound. Molecules are held together by C—H $\cdots$ O hydrogen bonding. There is distortion in the central oxalate section of the molecules and a short intermolecular H $\cdots$ H contact of 2.14 Å is present.

## The oxalate diester of dehydroepiandrosterone

P. J. Cox, L. Nahar, S. D. Sarker and A. B. Turner

### Comment

Crystal structures of DHEA forms have been published (Cox *et al.*, 1990; Caira *et al.*, 1995; Stahly *et al.*, 2006) and details of the importance, uses, preparation and spectroscopic data of the title compound and related symmetrical steroidal dimers are available (Nahar *et al.*, 2006). The atomic arrangement in the molecules of (I) are shown in Figures 1 & 2. There are no classical hydrogen bonds but weak C—H $\cdots$ O contacts hold the molecules together (Table 1). A short H61A $\cdots$ H7A<sup>i</sup> contact of 2.14 Å is also present where C61 $\cdots$ C7<sup>i</sup>=4.019 (4) Å and i indicates coordinates transformed by  $-1 + x, y, z$ . The length of the central Csp<sup>2</sup>—Csp<sup>2</sup> bond appears to be different in the two independent molecules with C20—C40=1.542 (4) Å and C60—C80=1.521 (3) Å, but the difference is similar to the accuracy limitation for light atoms caused by the spherical-atom scattering factor approximation (Coppens *et al.*, 1969). Long Csp<sup>2</sup>—Csp<sup>2</sup> bonds are also present in perfluoromethyloxalate (Védova *et al.*, 2004). The oxalate portions of the molecules deviate from planarity, as can be seen by the torsion angles. One oxalate moiety is considerably more non-planar than the other but the overall lengths of the molecules are similar (O3 $\cdots$ O6=24.895 (3) Å and O13 $\cdots$ O16=24.310 (3) Å). Differences in torsion angles are also evident in the two independent molecules, for example, the C13—C17 ring may be described as a C14 envelope whereas the C53—C57 ring conformation is twisted on C53—C54. The A, B and C ring conformations are chair, half-chair and chair, respectively.

### Experimental

Details of the synthesis of (I) have been published previously (Nahar *et al.*, 2006).

### Refinement

All non-hydrogen atoms were refined by full-matrix least squares calculations with anisotropic displacement parameters. All the hydrogen atoms were allowed to ride on their attached atoms with isotropic displacement parameters 1.2 (non-methyl) or 1.3 (methyl) times those of the  $U_{eq}$  of their attached atoms. The constrained distances C—H distances were 0.95—1.00 Å.

*Special details*

**Experimental.** Please note cell\_measurement\_fields are not relevant to area detector data, the entire data set is used to refine the cell, which is indexed from all observed reflections in a 10 degree phi range.

**Geometry.** Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles
