Received 16 July 2007; accepted 25 July 2007

Key indicators: single-crystal X-ray study; $T = 203\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.044; wR factor = 0.116; data-to-parameter ratio = 25.6.

Two new chalcones of general type (2E)-1-(3-hydroxyphenyl)-3-(4-R-phenyl)prop-2-en-1-one are reported, one where $R = \text{methyl}$, $\text{C}_{16}\text{H}_{14}\text{O}_2$, in the present paper, and one where $R = \text{chloro}$, $\text{C}_{15}\text{H}_{11}\text{ClO}_2$, in the following paper [Butcher, Jasinski, Narayana, Lakshmana & Yathirajan (2007). *Acta Cryst. E* **63**, o3661]. In both structures, the 3-hydroxyphenyl and 4-(methyl/chloro)phenyl groups are coplanar with each other and also with the propyl-2-ketone oxygen. Crystal packing is stabilized by intermolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonding between the hydroxyl H atom and the propyl-2-ketone O atom.

(2E)-1-(3-Hydroxyphenyl)-3-(4-methylphenyl)prop-2-en-1-one

R. J. Butcher, J. P. Jasinski, B. Narayana, K. Lakshmana and H. S. Yathirajan

Comment

Chalcones have been reported to possess many useful properties, including anti-inflammatory, antimicrobial, antifungal, antioxidant, cytotoxic, antitumor and anticancer activities. Among several organic compounds reported for non-linear optical (NLO) property, chalcone derivatives are noticeable materials for their excellent blue light transmittance and good crystallizability. We have synthesized two new chalcones, of general formula (2E)-1-(3-Hydroxyphenyl)-3-(4-R-phenyl)prop-2-en-1-one, with R=methyl ($C_{16}H_{14}O_2$) (I), reported in the present paper, and R=Chloro ($C_{15}H_{11}ClO_2$) (II), reported in the following one (Butcher *et al.*, 2007).

Fig. 1 presents a molecular diagram for (I).

The 3-hydroxyphenyl and 4-methylphenyl groups are coplanar with each other and with the propyl 2 ketone group forming torsion angles of $179.28(11)^\circ$, C7—C1—C2—C3, and $177.38(11)^\circ$, C9—C10—C15—C14, respectively.

Intermolecular O—H \cdots O hydrogen bonding interactions involving the H1 hydroxyl atom and prop-2-en O2 atom (Table 1) link the molecules (almost perpendicular to each other) into a planar array (Fig. 2). In spite of crystallizing in different space groups ((I) in $P21/n$, (II) in $P21/c$) both compounds are very nearly isostructural.

Experimental

To a mixture of 1-(3-hydroxyphenyl)ethanone, 1.36 g (0.01 mol) and 4-methylbenzaldehyde 1.2 g (0.01 mol) in ethanol (20 ml), a solution of potassium hydroxide (5%, 5 ml) was added slowly with stirring. The mixture was stirred at room temperature for 6 h. The precipitated solid was filtered, washed with cold ethanol, dried and the crystals were obtained from ethanol (yield: 83%; m.p.: 395–396 K). Elemental analysis found: C: 80.51; H: 5.85%. $C_{16}H_{14}O_2$ requires C, 80.65, H, 5.92%.

Refinement

All of the H atoms, except H1 which was located from difference Fourier map, were inferred from neighbouring sites. All H atoms were included in the riding model approximation with C—H = 0.94 or 0.97 Å, and with $U_{\text{iso}}(\text{H}) = 1.18\text{--}1.50 U_{\text{eq}}(\text{C}, \text{O})$.

Figures

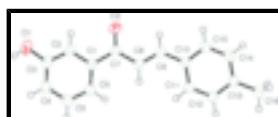

Fig. 1. Molecular structure of (I), showing atom labelling and 50% probability displacement ellipsoids.

supplementary materials

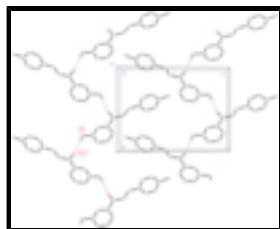

Fig. 2. Packing diagram of (I) viewed down the a axis. Dashed lines indicate O–H \cdots O hydrogen bonds. Symmetry code: as in Table 1

	$\Delta\rho_{\min} = -0.25 \text{ e \AA}^{-3}$

Primary atom site location: structure-invariant direct Extinction correction: none
methods

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
