Received 6 August 2007; accepted 7 August 2007

Key indicators: single-crystal X-ray study; $T = 153$ K; mean $\sigma(\text{C}-\text{C}) = 0.008 \text{ \AA}$; R factor = 0.060; wR factor = 0.160; data-to-parameter ratio = 15.5.

Two independent but similar molecules, *A* and *B*, comprise the asymmetric unit of the title compound, $C_8H_6\text{BrNO}_2$. Supramolecular chains, involving one type of molecule only, are formed via $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds. These are connected into layers via $\pi-\pi$ stacking [centroid-to-centroid separations = 3.763 (3)–3.783 (3) \AA] and $\text{C}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{Br}$ interactions, so that the global crystal packing comprises alternating layers of molecules *A* and *B*.

Related literature

For related literature, see: Wang *et al.* (2007). The similarity of molecules *A* and *B* was established using *PLATON* (Spek, 2003).

5-Amino-4-bromo-2-benzofuran-1(3H)-one

J. Wang, D. M. Johnson and E. R. T. Tiekink

Comment

The title compound (**I**), was investigated as a part of our ongoing studies into the preparation of polyamides (Wang *et al.*, 2007) and was obtained from a two-step reduction reaction sequence to convert 4-aminophthalimide to 5-aminophthalide (see Experimental). The structure of (**I**) was confirmed by crystallography (Fig. 1).

Two independent molecules of (**I**), A and B, comprise the asymmetric unit, which are virtually identical as seen in the RMS-fit of 0.042 Å (Spek, 2003). The nine atoms comprising the framework are co-planar with a maximum deviation of 0.032 (6) Å for the C1 atom in molecule A and 0.015 (4) Å for the O1 atom in molecule B.

The crystal packing is dominated by N—H···O hydrogen bonding (Table 1) between one of the amine-H atoms and carbonyl groups leading to chains aligned along the *b*-direction. Each chain comprises only molecules A or only molecules B; the second amine-H atom forms an intramolecular contact with the Br atom in each case. Chains stack along the *c*-direction to form layers. Within layers comprising molecules of A, the connections are of the type $\pi\cdots\pi$ with the distance between ring centroids of (C2–C7) being 3.783 (3) Å; symmetry operation: $x, 1/2 - y, -1/2 + z$. Further stabilization is afforded by C—H···Br contacts.

Within layers comprising molecules of B, there are also $\pi\cdots\pi$ contacts, this time between (C10–C15) rings of 3.763 (3) Å for symmetry operation: $x, 3/2 - y, 1/2 + z$.

The amine-H2a atom is bifurcated in that it also forms a weak interaction to the ring-O1 atom as well as to the Br2 atom. Finally, C—H···O contacts are found in these layers further distinguishing the intermolecular connectivities operating within the layers defined by molecules of A or molecules of B. A view of the crystal packing is shown in Fig. 2.

Experimental

In an ice bath and with stirring, aqueous NaOH (30%, 6.4 ml) and 0.2% CuSO₄ (4.2 ml) were added to Zn powder (6.36 g, 97.26 mmol). To this mixture was added 4-aminophthalimide (3.47 g, 21.37 mmol) over 30 min. The solid particles turned from yellow to orange, and the cloudy liquid was green. After 30 min stirring at room temperature, water (10 ml) was added and the reaction mixture was stirred at 353 K overnight. After cooling, a green-grey cloudy mixture was obtained. The precipitate was filtered off under reduced pressure. The filtrate was neutralized by 2 N HCl and further acidified with concentrated HCl (20 ml). Some solid precipitate formed when the pH was approximately 2. The mixture was heated to reflux for about 10 min, cooled to room temperature and then placed in a refrigerator. The yellow solid that precipitated was filtered off, washed with water (3 × 6 ml) and dried under vacuum at room temperature (yield 60%).

In a 100 ml round bottom flask, 5-aminophthalide (665.4 mg, 4.46 mmol) was dissolved in benzene (20 ml). After stirring for 5 min at room temperature, *N*-bromosuccinimide (886.1 mg, 49.8 mmol) and 2,2'-Azobis(2-methylpropionitrile) (AIBN) (108.6 mg, 0.66 mmol) were added to the reaction flask. The reaction mixture was heated overnight in an oil bath set at 348 K. The solvent was removed under reduced pressure. The residual was separated on a silica gel column (dry load), using

supplementary materials

hexane and ethyl acetate (1:1 v/v; $R_f = 0.44$). The product portion was collected and evaporated under reduced pressure (yield 48%). Orange needles of (I) were obtained by recrystallization from water/methanol (5:1 v/v).

^1H NMR (500 MHz, CDCl_3) δ (p.p.m.): 7.62 (d, 1H, aromatic H, $J = 8.29$ Hz), 6.81 (d, 1H, aromatic H, $J = 8.29$ Hz), 5.09 (s, 2H, α -CH $_2$), 4.69 (s, 2H, —NH $_2$). ^{13}C NMR (500 MHz, CDCl_3) δ (p.p.m.): 165.18 (—CO—), 149.34, 149.30, 125.91, 116.54, 116.12, 100.04, 69.44 (α -C). IR(cm^{-1}) 3470 (—NH $_2$), 3335 (—NH $_2$), 3206, 1725 (—CO—), 1618 (—NH $_2$), 1596, 1492, 1356, 1269, 1257, 1124, 1041, 1012, 953. LCMS (APCI, m/z) 230.1 (100), 228.5 (73), 231.1 (9).

Refinement

All the H atoms were included in the riding-model approximation, with C—H = 0.95–0.99 Å and N—H = 0.88 Å, and with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{N})$. The maximum and minimum difference peaks are located 1.30 and 0.68 Å, respectively, from Br2.

Figures

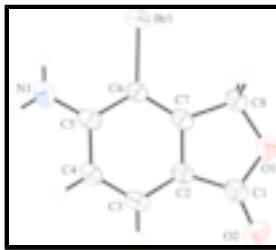

Fig. 1. Molecular structure of (I) showing atom-labelling scheme and displacement ellipsoids at the 50% probability level (arbitrary spheres for the H atoms).

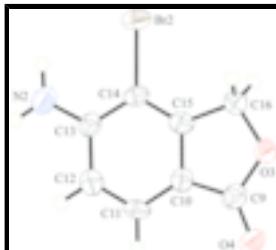

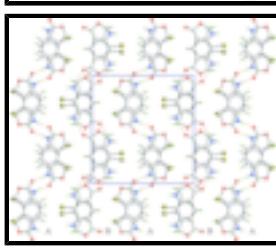

Fig. 2. View of the crystal packing in (I) highlighting the alternating layers molecules A and B. The N—H \cdots O hydrogen bonds are shown as orange-dashed lines. Colour code: olive (bromine), red (oxygen), blue (nitrogen), grey (carbon) and green (hydrogen).

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
