Received 19 July 2007; accepted 6 August 2007

Key indicators: single-crystal X-ray study; $T = 291$ K; mean $\sigma(\text{C}-\text{C}) = 0.008$ Å; disorder in solvent or counterion; R factor = 0.065; wR factor = 0.215; data-to-parameter ratio = 11.2.

The asymmetric unit of the title compound, $\text{C}_{21}\text{H}_{20}\text{N}_3\text{O}^+\cdot\text{PF}_6^-$, contains two independent 1-benzyl-3-(8-methoxyquinolin-2-ylmethyl)imidazolium cationic units and two PF_6^- ions. The two cationic units differ slightly in the orientations of the benzylimidazolium group with respect to the quinoline ring system. In one of the cationic units, the quinoline ring system and the phenyl ring form dihedral angles of 76.0 (1) and 73.8 (1)°, respectively, with the central five-membered ring, and in the other unit these angles are 85.6 (1) and 69.0 (2)°, respectively. Both hexafluoridophosphate ions are found to be disordered over two positions, with site occupancies of *ca* 0.74 and 0.26. The crystal packing is stabilized by $\text{C}-\text{H}\cdots\text{F}$ and $\text{C}-\text{H}\cdots\text{N}$ hydrogen bonds.

1-Benzyl-3-(8-methoxyquinolin-2-ylmethyl)imidazolium hexafluoridophosphate

X.-N. Fan, G.-L. XiaHou, Z.-Q. Huang and Y.-C. Ding

Comment

Numerous flexible and rigid N-heterocyclic carbene precursors have been synthesized and studied. They have attracted considerable attention because of their diverse coordination capabilities and the important catalytic properties of their metal complexes (Herrmann, 2002; Herrmann & Kocher, 1997). We report here the crystal structure of the title compound.

The asymmetric unit of the title compound contains two independent $[\text{C}_{21}\text{H}_{20}\text{N}_3\text{O}]^+$ cationic units and two PF_6^- ions (Fig. 1). The two cationic units differ in the orientations of the benzylimidazolium group with respect to the quinoline ring system. Bond lengths and angles in the title compound show normal values. The quinoline ring system in each independent molecule is planar.

The N1/C1–C9 and C16–C21 planes form dihedral angles of $76.0 (1)^\circ$ and $73.8 (1)^\circ$, respectively, with the N2/N3/C12–C14 plane. The N6/C22–C30 and C37–C42 planes form dihedral angles of $85.6 (1)^\circ$ and $69.0 (2)^\circ$, respectively, with the N2/N3/C12–C14 plane.

As can be seen from Fig. 2, the hexafluorophosphate ions are linked to 1-benzyl-3-(2-methylene-8-methoxyquinoline)imidazolium ions through C—H \cdots F hydrogen bonds (Table 1). A C—H \cdots N hydrogen bond is also observed.

Experimental

The title compound was synthesized by the reaction of 2-bromomethyl-8-methoxy-quinoline (0.25 g) with 1-benzyl-1*H*-imidazole (0.2 g) in tetrahydrofuran at 350 K, according to a literature method (Lee *et al.*, 2004). A white precipitate was obtained, and it was dissolved in methol (5 ml) and then ammonium hexafluorophosphate (0.2 g) was added. The resulting solid was filtered off, washed with ethyl ether and air-dried. White single crystals suitable for X-ray diffraction were obtained by recrystallization from absolute acetonitrile and ethyl ether (1:2).

Refinement

Both hexafluorophosphate ions were found to be disordered over two positions, with refined site occupancies of 0.742 (10) and 0.258 (10) [P1,F1–F6/P1',F1'–F6'] or 0.739 (19) and 0.261 (19) [P2,F7–F12/P2',F2'–F12']. The P—F and F \cdots F distances were restrained to 1.57 (1) and 2.21 (2) Å, and the displacement parameters of all disordered atoms were restrained to an approximate isotropic behaviour. H atoms were positioned geometrically, with C—H = 0.93, 0.96 and 0.97 Å for aromatic, methyl and methylene H atoms, respectively, and constrained to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ or $1.5U_{\text{eq}}(\text{methyl C})$.

Figures

Fig. 1. The asymmetric unit of the title compound, showing 30% probability displacement ellipsoids and the atomic numbering. Only the major disorder component is shown.

Fig. 2. The crystal of the packing of the title compound, viewed along the *a* axis. C—H...F and C—H...N hydrogen bonds are shown as dashed lines. Only the major disorder component is shown.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.065$	H-atom parameters constrained
$wR(F^2) = 0.215$	$w = 1/[\sigma^2(F_o^2) + (0.0928P)^2 + 1.4093P]$
$S = 1.05$	where $P = (F_o^2 + 2F_c^2)/3$
7961 reflections	$(\Delta/\sigma)_{\max} = 0.001$
708 parameters	$\Delta\rho_{\max} = 0.50 \text{ e } \text{\AA}^{-3}$
240 restraints	$\Delta\rho_{\min} = -0.24 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: SHELXL97 (Sheldrick, 1997), $F_c^* = kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
	Extinction coefficient: 0.0057 (11)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
