Received 28 August 2007; accepted 29 August 2007

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(\text{C}-\text{C}) = 0.013$ Å; R factor = 0.030; wR factor = 0.085; data-to-parameter ratio = 24.0.

The asymmetric unit of the title compound, $(\text{C}_{12}\text{H}_{28}\text{N}_2\text{O}_4)\text{[PtCl}_6\text{]}\cdot 2\text{H}_2\text{O}$, contains one half-cation, one half-anion and one water molecule, both ions lying on inversion centres. The Pt ion has an octahedral coordination. In the crystal structure, intermolecular $\text{O}-\text{H}\cdots\text{Cl}$, $\text{N}-\text{H}\cdots\text{O}$ and $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds result in the formation of a supramolecular structure.

1,10-Diazonia-18-crown-6 hexachloridoplatinate(IV) dihydrate

M. Yousefi, S. Teimouri, V. Amani and H. R. Khavasi

Comment

Recently, we reported the synthesis and crystal structure of $[(\text{H}_2\text{DA18C6})\text{Cl}_2]$, (II), (Yousefi *et al.*, 2007) [where $\text{H}_2\text{DA18C6}$ is 1,10 -Diazonia-18-crown-6]. Several proton transfer systems using 1,10-diaza-18 -crown-6, with proton donor molecules, such as $[(\text{H}_2\text{DA18C6})\text{I}_2 \cdot 2\text{H}_2\text{O}]$, (III), (Chekhlov, 2005), $[(\text{H}_2\text{DA18C6})(\text{C}_2\text{HO}_4)_2]$, (IV), and $[(\text{H}_2\text{DA18C6})_2(\text{C}_2\text{O}_4)_2 \cdot 2\text{H}_2\text{O}]$, (V), (Chekhlov, 2000), $[(\text{H}_2\text{DA18C6})(\text{picrate})_2]$, (VI), (Chekhlov, 2001), $[(\text{H}_2\text{DA18C6})(\text{HPTD})_2]$, (VII), (Simonov *et al.*, 2003), $[(\text{H}_2\text{DA18C6})(\text{PD})_2 \cdot (\text{H}_2\text{O})_4]$, (VIII), and $[(\text{H}_2\text{DA18C6})(\text{PS})_2 \cdot (\text{H}_2\text{O})_2]$, (IX), (Fonari *et al.*, 2004), $[(\text{H}_2\text{DA18C6})(\text{CCl}_3\text{COO})_2(\text{CCl}_3\text{COOH})_2]$, (X), (Chekhlov *et al.*, 1994), $[(\text{H}_2\text{DA18C6})(\text{CCl}_3\text{COO})_2]$, (XI), (Chekhlov & Martynov, 1998), and $\{[\text{H}_2\text{DA18C6}][(\text{ArSO}_2)_2\text{N}]_2\}$, (XII), (Moers *et al.*, 2000) [where $\text{H}_2\text{DA18C6}$ is 1,10-Diazonia-18-crown-6, C_2O_4 is oxalate, HPTD is (4Z,5E)-pyrimidine-2,4,5,6(1H,3H)-tetraone 4,5-dioxime anion, PD is 2-(2-methylphenyl)-2H-[1,2,3]triazolo[4,5-d] pyrimidine-5,7(4H,6H)-dione 3-oxide anion, PS is 6-amino-2,4-dioxo-1,2,3,4-tetrahydropyrimidin-5-yl- sulfamate and $(\text{ArSO}_2)_2\text{N}$ is bis(4-chlorobenzenesulfonyl)imide] have been synthesized and characterized by single-crystal X-ray diffraction methods.

There are also several proton transfer systems using $\text{H}_2[\text{PtCl}_6]$ with proton acceptor molecules, such as $[\text{Hpy-Br-3}]_2[\text{PtCl}_6] \cdot 2\text{H}_2\text{O}$, (XIII), and $[\text{HpyI-3}]_2[\text{PtCl}_6] \cdot 2\text{H}_2\text{O}$, (XIV), (Zordan & Brammer, 2004), $[\text{BMIM}]_2[\text{PtCl}_6]$, (XV), and $[\text{EMIM}]_2[\text{PtCl}_6]$, (XVI), (Hasan *et al.*, 2001), $\{(\text{DABCO})\text{H}_2[\text{PtCl}_6]\}$, (XVI), (Juan *et al.*, 1998), $\{p\text{-C}_6\text{H}_4(\text{CH}_2\text{ImMe})_2[\text{PtCl}_6]\}$, (XVIII), (Li & Liu, 2003), $[\text{het}][\text{PtCl}_6] \cdot 2\text{H}_2\text{O}$, (XIX), (Hu *et al.*, 2003), $[\text{9-MeGuaH}]_2[\text{PtCl}_6] \cdot 2\text{H}_2\text{O}$, (XX), (Terzis & Mentzafos, 1983) and $[\text{H}_{10}[30]\text{aneN}_{10}][\text{PtCl}_6]_2\text{Cl}_6 \cdot 2\text{H}_2\text{O}$, (XXI), (Bencini *et al.*, 1992) [Where BMIM^+ is 1-*n*-butyl-3-methylimidazolium, EMIM^+ is 1-ethyl-3-methyl- imidazolium, DABCO is 1,4-diazabicyclooctane, het is 2-(?-hydroxyethyl) thiamine and 9-MeGuaH is 9-methylguaninium] have been synthesized and characterized by single-crystal X-ray diffraction methods. We report herein the synthesis and crystal structure of the title compound, (I).

The asymmetric unit of (I), (Fig. 1), contains one half-cation, one half-anion and one water molecule. The Pt ion has an octahedral coordination. The bond lengths and angles, in cation, are in good agreement with the corresponding values in (II) and (III). Also, the Pt—Cl bond lengths and angles (Table 1) are within normal ranges, as in $[\text{H}_{10}[30]\text{ane}][\text{PtCl}_6]_2\text{Cl}_6 \cdot 2\text{H}_2\text{O}$, (XXII), (Bencini *et al.*, 1992).

In the crystal structure, the intermolecular O—H \cdots Cl, N—H \cdots O and O—H \cdots O hydrogen bonds (Table 2) seem to be effective in the stabilization of the crystal structure, resulting in the formation of a supramolecular structure (Fig. 2).

Experimental

For the preparation of the title compound, (I), a solution of 1,10-diaza-18 -crown-6 (0.10 g, 0.37 mmol) in water (50 ml) was added to a solution of $\text{H}_2\text{PtCl}_6 \cdot 2\text{H}_2\text{O}$ (0.20 g, 0.37 mmol) in water (30 ml) and the resulting yellow solution was stirred

supplementary materials

for 30 min at 333 K. Then, it was left to evaporate slowly at room temperature. After 24 h, yellow prismatic crystals of (I) were isolated (yield; 0.22 g, 84%, m.p. 470–472 K).

Refinement

H3C and H3D (for OH₂) were located in difference syntheses and refined isotropically [O—H = 0.69 (10) and 0.79 (7) Å and $U_{\text{iso}}(\text{H}) = 0.062$ (19) and 0.08 (3) Å²]. The remaining H atoms were positioned geometrically, with N—H = 0.90 Å and C—H = 0.97 Å for methylene H, and constrained to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{N})$.

Figures

Fig. 1. The molecular structure of the title molecule, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level. [symmetry codes: (a) $1 - x, 2 - y, 1 - z$; (b) $-x, 2 - y, -z$].

Fig. 2. A partial packing diagram of (I). Hydrogen bonds are shown as dashed lines.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.030$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.085$	$w = 1/[\sigma^2(F_o^2) + (0.0394P)^2 + 0.839P]$
$S = 1.22$	where $P = (F_o^2 + 2F_c^2)/3$
3168 reflections	$(\Delta/\sigma)_{\text{max}} = 0.011$
132 parameters	$\Delta\rho_{\text{max}} = 1.27 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\text{min}} = -0.66 \text{ e } \text{\AA}^{-3}$
	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
