Received 13 September 2007; accepted 14 September 2007

 Key indicators: single-crystal X-ray study; $T = 150$ K; mean $\sigma(\text{C}-\text{C}) = 0.012$ Å; R factor = 0.032; wR factor = 0.101; data-to-parameter ratio = 15.9.

The title compound, $(\text{PPh}_4)_2[\text{Pd}_2\text{I}_6]$, was obtained unintentionally as the product of an attempted synthesis of a tripalladium sandwich complex. The molecular dimensions are unexceptional and the Pd...Pd distance, at 3.8183 (12) Å, is much too long for any Pd–Pd interaction. Pd has a typical square-planar coordination geometry and the centrosymmetric anion is essentially planar.

Related literature

The PPh_3Me^+ salt has also been reported (Tonde *et al.*, 2005). For other examples of $[\text{Pd}_2\text{I}_6]^{2-}$, see Chan *et al.* (1996), Evans *et al.* (2002), Maassarani *et al.* (1987), Neve *et al.* (2000) and Neve & Crispini (2003). For the Cambridge Structural Database, see Allen (2002).

Bis(tetraphenylphosphonium) di- μ -iodido-bis[diiodidopalladate(II)]

F. Mulligan, G. S. Nichol and S. K. Hurst

Comment

The title compound, (I), was obtained unintentionally as the product of an attempted synthesis of a tripalladium sandwich complex. The $[\text{Pd}_2\text{I}_6]^{2-}$ ion lies on an inversion centre and thus the asymmetric unit is one-half of the complete chemical formula.

Both palladium centres have typical d^8 square-planar geometry and are bridged by two iodide ligands, with four terminal iodide ligands completing this discrete species. A search of the Cambridge Structural Database (Version 5.28 with two updates; Allen, 2002) shows that there are only 8 reported crystallographic examples of this unit. Two tetraphenylphosphonium cations balance the 2- charge. Molecular dimensions are unexceptional and the Pd...Pd distance, at 3.8183 (12) Å, is much too long for any Pd—Pd interaction.

The crystal packing consists mostly of coulombic and London forces, with the exception that the tetraphenylphosphonium cations show the typical phenyl embrace interactions usually encountered with this type of species.

Experimental

200 mg of $\text{Pd}_2(\text{dba})_3$ (dba = dibenzylideneacetone) was stirred with 46 mg of $\text{C}_7\text{H}_7\text{-BF}_4$ and 445 mg of PPh_4I in 30 ml of CH_2Cl_2 for 30 minutes at room temperature. The solvent was removed under vacuum and the residue recrystallized by slow evaporation of an acetonitrile solution. Yield = 12%. ^1H NMR: (400 MHz, CDCl_3): δ (p.p.m.) = 7.05 – 8.05 (40 H, m, Ph). ^{31}P NMR: (400 MHz, CDCl_3): δ (p.p.m.) = 24.2.

Refinement

All hydrogen atoms were initially located in a difference map and then refined using a riding model with $U_{\text{iso}}(\text{H})=1.2U_{\text{eq}}(\text{C})$. The C–H distances were constrained to be 0.95 Å.

Figures

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
