**NH<sub>4</sub>PbI<sub>3</sub>**

Le-Qing Fan\* and Ji-Huai Wu

Institute of Materials Physical Chemistry and the Key Laboratory for Functional Materials of Fujian Higher Education, Huaqiao University, Quanzhou, Fujian 362021, People's Republic of China

Correspondence e-mail: lqfan@hqu.edu.cn, jhwu@hqu.edu.cn

Received 8 October 2007; accepted 15 October 2007

Key indicators: single-crystal X-ray study;  $T = 293$  K; mean  $\sigma(b-I) = 0.001$  Å;  $R$  factor = 0.033;  $wR$  factor = 0.083; data-to-parameter ratio = 27.7.

Single crystals of ammonium lead iodide, NH<sub>4</sub>PbI<sub>3</sub>, have been obtained by solid-state reactions. Each Pb<sup>II</sup> ion is coordinated by six I<sup>-</sup> ions in a distorted octahedral environment. PbI<sub>6</sub> octahedra are connected by common edges, forming a one-dimensional anion chain. All atoms except one H atom in a general position have site symmetry  $m$ .

## NH<sub>4</sub>PbI<sub>3</sub>

L.-Q. Fan and J.-H. Wu

### Comment

Considerable current interests focus on fundamental as well as more applied studies of iodoplumbates related to their significant structural, electrical, non-linear optical, and other physical properties (Mitzi *et al.*, 1995; Guloy *et al.*, 2001; Fan *et al.*, 2006). Lead(II) iodide and its low-dimensional derivatives represent a potential class of functional materials. We report here the crystal structure of the title lead(II) iodide complex, which has a one-dimensional anion chain.

There is one crystallographically independent Pb<sup>II</sup> ion in the asymmetric unit (Fig. 1). Pb<sup>II</sup> ion is six-coordinated in a distorted octahedral environment by six I<sup>-</sup> ions with Pb—I distances ranging from 3.0595 (9) to 3.3679 (9) Å and *cis* I—Pb—I angles from 84.40 (2) to 94.78 (2)° (Table 1). Adjacent octahedra are joined by a common edge (I1/I3) to form a chain; two neighboring chains are connected through a common edge (I1/I1) to form a one-dimensional anion chain [PbI<sub>3</sub>]<sub>n</sub><sup>n-</sup> along the *b* axis (Fig. 2). As a consequence of the connectivity of PbI<sub>6</sub> octahedra, the I<sup>-</sup> ions are acting as μ<sub>3</sub> (I1) and μ bridge (I3) and as a terminal ligand (I2). The longest Pb—I bond length is observed for the triply bridging ligand I1 due to its higher connectivity and the *trans* influence of the terminal ligand I2 in *trans* position to I2 (Krautscheid, *et al.*, 2001). At 473 K, the C—N bonds of [Bu<sub>4</sub>N]<sup>+</sup> are broken, so the cation of [NH<sub>4</sub>]<sup>+</sup> is formed. The anion chain has no significant hydrogen-bonding interactions with the cations.

### Experimental

A mixture of PbI<sub>2</sub> (92 mg, 0.2 mmol) and Bu<sub>4</sub>Ni (74 mg, 0.2 mmol) was pressed into a pellet, which was then sealed into an evacuated quartz tube. The quartz tube was heated at 473 K for 2 days, and then cooled slowly to room temperature. Prism-shaped yellow crystals of suitable for X-ray analysis were obtained.

### Refinement

The N—H distances were restrained to 0.80 (2) Å. The displacement parameters of H atoms were set at 1.5 times *U*<sub>eq</sub> of the N atom. The highest peak is located 1.17 Å from I1 and the deepest hole is located 0.74 Å from Pb1.

### Figures

Fig. 1. The asymmetric uni of (I), together with additional I atoms to complete the coordination of Pb atom. Displacement ellipsoids are plotted at the 50% probability level. [Symmetry code: (A)  $x, 1 + y, z$ ; (B)  $1 - x, 1 - y, 1 - z$ , (C)  $x, -0.5 - y, z$ ]

$l = -22 \rightarrow 17$

### Refinement

Refinement on  $F^2$

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.033$

$wR(F^2) = 0.083$

$S = 1.02$

1080 reflections

39 parameters

9 restraints

Primary atom site location: structure-invariant direct  
methods

Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring  
sites

Only H-atom coordinates refined

$$w = 1/[\sigma^2(F_o^2) + (0.0484P)^2 + 2.6931P]$$

where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\text{max}} < 0.001$

$\Delta\rho_{\text{max}} = 1.11$  e Å<sup>-3</sup>

$\Delta\rho_{\text{min}} = -1.78$  e Å<sup>-3</sup>

Extinction correction: none

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
