Received 27 September 2007; accepted 5 October 2007

Key indicators: single-crystal X-ray study; $T = 150$ K; mean $\sigma(C-C) = 0.006$ Å; R factor = 0.052; wR factor = 0.147; data-to-parameter ratio = 19.4.

In the molecule of the title compound, $[TiBr_2(C_{13}H_{14})]$, the Ti^{IV} centre is in a distorted tetrahedral environment involving two η^5 -bonded cyclopentadienyl rings of a propane-2,2-diylidicyclopentadienyl ligand [$Ti-Cg = 2.045$ (2) Å; Cg is the centroid of the cyclopentadienyl ring] and two Br atoms [$Ti-Br = 2.5115$ (7) Å]. The presence of the short 2,2-propylidene bridge between the two cyclopentadienyl rings constrains the $Cg-Ti-Cg$ angle to a value of 121.32 (9)°. The Ti and central C atoms are located on a crystallographic C_2 axis.

Dibromido(η^5,η^5 -propane-2,2-diylidicyclopentadienyl)titanium(IV)

M. Erben, I. Cíšarová, M. Dusek, J. Vinklárek and M. Picka

Comment

Group 4 cyclopentadienyl complexes belong to important class of catalysts for methylalumoxane-promoted polymerization of olefines. In order to find a relationship between the structure and catalytic activity, large series of variously substituted derivatives have been synthesized. It was found that incorporation of short interannular bridge connecting both cyclopentadienyl rings leads to disclosing of electronically unsaturated central metal atom that is better accessible to be attacked by electron-rich olefin. We prepared the title complex, (I), in the framework of our investigation of catalytically active cyclopentadienyl complexes and we report herein its crystal structure.

In the molecule of the title compound, (I), Ti1 and C6 atoms are located on a crystallographic C_2 axis (Fig. 1). It is a typical ansa-metallocene structure with two cyclopentadienyl rings interconnected together with propylidene bridge. The Ti^{IV} centre is in a distorted tetrahedral environment involving two η^5 -bonded cyclopentadienyl rings of (C₁₃H₁₄)²⁻ ligand and two Br atoms (Table 1).

In (I), the angle between the planes of cyclopentadienyl rings is 65.8 (3) $^\circ$, in which it reflects the degree of the disclosure of the central C6 atom. In the analogous dichloride {TiCl₂[(C₅H₄)₂C(CH₃)₂]}, (II), (Koch *et al.*, 2000) and difluoride {TiF₂[(C₅H₄)₂C(CH₃)₂]}, (III), (Picka *et al.*, 2005) complexes, the observed angles are 66.8 (10) $^\circ$ in (II) and 65.76 (9) $^\circ$ in (III).

The Ti1—Cg [2.045 (2) Å; Cg is the centroid of cyclopentadienyl ring] distance in (I) is shorter than the reported value [Ti—Cg = 2.193 Å] in (II), but it is nearly the same with the corresponding values [Ti1—Cg1 = 2.0558 (7) Å and Ti1—Cg2 = 2.0567 (8) Å] in (III). In (I), the Ti1—Br1 distance is 2.5115 (7) Å. The constraining of the Cg—Ti—Cg angle to a value of 121.32 (9) $^\circ$ is caused by the presence of the short 2,2-propylidene bridge between the two cyclopenta-dienyl rings.

On the inspection of ascertained geometric parameters, it is evident that the substitution of halide ligands in ansa-complexes of this type has no significant impact on the structure of [Ti(C₁₃H₁₄)]²⁺ unit.

Experimental

Compound (I) was prepared from the chloride derivative (II) by the reaction with boron tribromide in dichloromethane. Starting complex (II) (0.22 g, 0.69 mmol) was dissolved in dry dichloromethane (20 ml) and boron tribromide (0.47 mmol, 0.045 ml) was added. The green-coloured reaction mixture was stirred for 2 h at room temperature and volatiles were evaporated *in vacuo*. The solid residue was washed three times with hexane (10 ml) and dried in vacuo (yield; 0.2 g, 75%). Upon slow evaporation of saturated chloroform solution at 270 K, green crystals of (I) suitable for X-ray analysis were obtained.

supplementary materials

Refinement

The highest peak in the final difference electron-density map is located 1.05 Å from the Br1 atom. H atoms were positioned geometrically, with C—H = 0.93 and 0.97 Å, for aromatic and methyl H atoms and constrained to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = xU_{\text{eq}}(\text{C})$, where $x = 1.2$ for aromatic H and $x = 1.5$ for methyl H atoms.

Figures

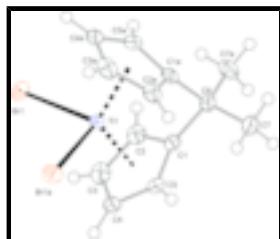

Fig. 1. The molecular structure of the title molecule, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level [symmetry code (*a*): $2 - x, y, 3/2 - z$].

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Symmetry codes: (i) $-x+2, y, -z+3/2$.

Table 1
Selected geometric parameters (\AA , $^\circ$).

Ti—Cg1	2.045 (2)	C1—C6—C1a	96.8 (4)
Ti—Br1	2.5115 (7)	C7—C6—C7a	110.8 (4)
Cg1—Ti—Cg1a	121.32 (9)	P _{r1} —C1—C6	15.5 (3)
Br1—Ti—Br1a	96.87 (3)	P _{r1} —P _{r1a}	65.8 (3)

Cg1 and Cg1a are the centroids defined by atoms C1—C5 and C1a—C5a, respectively. P_{r1} and P_{r1a} are the ring planes defined by atoms C1—C5 and C1a—C5a, respectively [Symmetry code: (a) $2 - x, y, 3/2 - z$].
