Received 28 August 2007; accepted 15 October 2007

Key indicators: single-crystal X-ray study; $T = 150$ K; mean $\sigma(\text{C}-\text{C}) = 0.017$ Å; disorder in solvent or counterion; R factor = 0.059; wR factor = 0.133; data-to-parameter ratio = 8.4.

The title methanol solvate, $[\text{CoCl}_2(\text{C}_{18}\text{H}_{15}\text{OP})_2] \cdot 0.125\text{CH}_3\text{OH}$, crystallized when a methanol solution of $\text{CoCl}_2(\text{OPPh}_3)_2$, contained in a 0.7 mm diameter tube, was subjected to vapour diffusion using Et_2O antisolvent but the more common unsolvated crystals formed when a 10 mm tube was used. The four crystallographically distinct $\text{CoCl}_2(\text{OPPh}_3)_2$ molecules in the asymmetric unit of the title structure have similar configurations. In each case, one O–P bond projects into the region between the two Cl atoms [$\text{P}-\text{O}-\text{Co}-\text{Cl} = 21.2$ (8)– 42.1 (8) $^\circ$], and the other is directed away [$\text{P}-\text{O}-\text{Co}-\text{Cl} = 110.9$ (8)– 147.4 (6) $^\circ$]. The Cl–Co–Cl angles range from 116.4 (1) to 125.6 (1) $^\circ$ and O–Co–O from 104.3 (3) to 107.2 (2) $^\circ$. The crystal studied was an inversion twin.

Related literature

Unsolvated crystal structures of the title compound have been reported previously by Cotton *et al.* (2002) and Marsh (1997), who re-analysed a determination by Mangion *et al.* (1976). These structures are identical and isostructural with the analogous complexes of Mn(II) (Tomita, 1985), Ni(II) (Moreno-Fuquen *et al.*, 2004), Cu (II) (Bertrand & Kalyanaraman, 1971 and Weinberger *et al.*, 1997) and Zn(II) (Rose *et al.*, 1980 and Kosky *et al.*, 1982). A THF solvate of the latter complex has also been reported (Zeller *et al.*, 2001).

Dichloridobis(triphenylphosphine oxide)cobalt(II) methanol 0.125-solvate, a lamellar structure

R. Lancaster and R. G. Pritchard

Comment

The title methanol solvate crystallized when a methanolic solution of $\text{CoCl}_2(\text{OPPh}_3)_2$, contained in a 0.7 mm tube, was subjected to vapour diffusion using Et_2O anti-solvent. The more common unsolvated crystals formed when a 10 mm diameter tube was used.

All unsolvated 1st row d-block $\text{MCl}_2(\text{OPPh}_3)_2$ crystal structures are isostructural, crystallizing in orthorhombic space group $Fdd2$ with each molecule having strict crystallographic C_2 symmetry. In each case the O—P bonds project into the region between the two Cl ligands with a stagger angle ranging from 36.8 (2) to 42.3 (4)°, as measured by the P—O—M—Cl torsion angles. This contrasts with the situation in the only previously reported solvated structure, a Zn complex containing THF of crystallization, in which the two P atoms nearly eclipse the Zn—Cl bonds with P—O—Zn—Cl torsion angles of 8.3 (2) and 8.8 (2)°. In this case the O—P bonds project into a region just outside the range subtended by the two Cl atoms.

The four crystallographically distinct $\text{CoCl}_2(\text{OPPh}_3)_2$ molecules, which comprise the title structure (Figs. 1–5), have similar configurations to each other but differ from the above structures. In each case one O—P bond projects into the region between the two Cl atoms (P—O—Co—Cl 21.2 (8) to 42.1 (8)°), and the other is directed away (P—O—Co—Cl 110.9 (8) to 147.4 (6)°). Comparison of the pseudo-tetrahedral geometry in the title structure with that in the unsolvated Co structures shows that the above torsional changes are accompanied by other significant bond length and angle changes (Table 1).

The lamellar nature of the title structure can be seen in the packing diagrams (Fig. 6). The methanol, which semi-populates its interlayer sites and displays high vibrational amplitudes, does not form well defined interactions with the host molecules. Furthermore residual voids (total 35 Å³) in the interlayer region suggest that solvent molecules may have been lost after crystallization.

It is interesting to speculate what role the narrower crystallization container may have had in directing the formation of this lamellar solvate. As a greater depth of anti-solvent was attained in the narrower 0.7 mm crystallization tube, compared to what was achieved in the 10 mm bore tube, it would seem reasonable to suggest that the a mixed $\text{Et}_2\text{O}/\text{MeOH}$ solvate may have been formed initially, with the reported structure resulting from partial solvent loss.

Experimental

Equal volumes of 0.1 M $\text{Ph}_3\text{P}=\text{O}$ and CoCl_2 solutions in methanol (*ca* 5 drops) were mixed before being syringed into a 0.7 mm diameter special glass X-ray sample tube to a depth of 4 mm. This tube was sealed in a larger sample tube containing *ca* 2 ml Et_2O anti-solvent. The solvent level rose to the top of the 0.7 mm tube overnight (*ca* 30 mm), inducing the crystallization of blue plates. A suitable crystal was selected by immersing the 0.7 mm tube in fluorinated oil on a microscope slide before

supplementary materials

crushing the glass to release the crystals. It is hoped that this method of working reduced solvent loss during crystal selection and transfer to the diffractometer.

Refinement

Hydrogen atoms were constrained to chemically reasonable positions. The methanol solvate molecule was treated isotropically with refined partial site occupancy, which was eventually fixed at 0.5 to allow the refinement to fully converge. Refinement of the Flack parameter indicated the presence of a racemic twin with twin components ratio 0.60 (4):0.40 (4).

2 restraints	Absolute structure: Flack (1983)
	Flack parameter: 0.40 (4)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Table 1. Comparison of geometry in $\text{CoCl}_2(\text{OPPh}_3)_2$ molecules

	(I)* range	(I) average	(IIa)	(IIb)
Co-Cl (Å)	2.221 (3)–2.260 (3)	2.242	2.227 (1)	2.203 (3)
Co-O (Å)	1.952 (6)–1.988 (6)	1.971	1.971 (2)	1.998 (7)
Cl-Co-Cl (°)	116.4 (1)–123.6 (1)	119.7	112.76 (6)	114.1 (1)
O-Co-O (°)	104.3 (3)–107.2 (2)	105.3	97.9 (2)	96.3 (3)
Co-O-P (°)	138.4 (4)–154.3 (4)	145.8	153.6 (2)	152.6 (5)

* (I) refers to the title structure and (II) to the unsolvated complex, (IIa) Cotton *et al.* (2002) and (IIb) Marsh (1997) with e.s.ds taken from Mangion *et al.* (1976)
