Received 16 October 2007; accepted 23 October 2007

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.010$ Å; R factor = 0.023; wR factor = 0.059; data-to-parameter ratio = 16.8.

Each Pt atom in the dimeric iodide-bridged title compound, $[\text{Pt}_2\text{I}_4(\text{C}_{18}\text{H}_{15}\text{P})_2]$, is tetracoordinated by a triphenylphosphine P and three I atoms in an approximately square-planar geometry. The *trans* influence of triphenylphosphine is evident from the longer Pt–I bond length.

Di- μ -iodido-bis[iodido(triphenylphosphine- κ P)platinum(II)]

A. N. Biswas, V. Bagchi, P. Das and P. Bandyopadhyay

Comment

The dimeric halogen bridged complexes of platinum(II) are very important in synthetic organometallic chemistry (Chatt, 1951 & Chatt and Venanzi, 1955). The main application of the halide bridged complexes is in reactions in which the bridged is cleaved to give monomeric complexes (Chatt and Venanzi, 1957 & Chatt *et al.*, 1964). Recently cytotoxicity of some dimeric iodo bridged platinum(II) complexes has been established (Jinchao *et al.*, 2006). Against this background we report here the crystal structure of (I).

The molecular structure of the title compound, (I), is shown in Fig. 1, with the atom numbering scheme. The packing arrangement of (I) is shown in Fig. 2. The platinum atom is tetracoordinated with a donor set of one triphenylphosphine P atom and three I atoms in an approximately squareplanar geometry. One of the three iodine atoms is a terminal I, and the other two are bridging I for each platinum atom. Selected bond lengths and bond angles are listed in Table 1. The Pt—I bond lengths *trans* to the triphenylphosphine moieties are longer and this is supposed to be due to the *trans*-influence of the P atom of the triphenylphosphine moiety. On the other hand Pt—P distances are quite close to the reported values (Black *et al.*, 1969) indicating absence of definite correlation between Pt—P distances and the *trans* influence of the ligand in the *trans* position. This, in turn, is indicative of the fact that Pt(II)—P bonds are not simple sigma bonds, but are more complex and therefore affected by the *trans* ligands in a more complex way than Pt(II)—I bonds.

Experimental

The title compound (I) was synthesized by stirring a mixture of di- μ -chlorido-bis[η^3 -2-methylallylplatinum(II)], triphenylphosphine and iodine in chloroform medium. The pink compound was isolated by chromatographic technique. Crystals suitable for X-ray crystallography was obtained from a mixture of dichloromethane and hexane (1:5 v/v).

Refinement

H atoms were included at calculated positions as riding atoms with C—H set to 0.93 Å for aromatic H atoms, with $U_{iso}(H) = 1.2U_{eq}(C)$.

Figures

Fig. 1. The asymmetric unit of (I), with displacement ellipsoids drawn at the 50% probability level.

Fig. 2. The molecular arrangement of (I) in the *ac* plane. H atoms are omitted for clarity.

397 parameters

$$\Delta\rho_{\min} = -0.70 \text{ e } \text{\AA}^{-3}$$

Primary atom site location: structure-invariant direct methods

Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
