Received 5 September 2007; accepted 1 October 2007

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.048; wR factor = 0.129; data-to-parameter ratio = 13.7.

The title compound, $\text{C}_{18}\text{H}_{18}\text{O}_4$, crystallizes with half a molecule in the asymmetric unit. The molecule is centrosymmetric and the inversion centre is located in the middle of the furylic C–C bond. The furan rings show an exactly parallel orientation and the alkynyl groups have a parallel orientation with respect to the furan ring systems. Intermolecular C–H···O hydrogen bonds are present in the crystal structure.

Comment

In the course of the investigation of the synthetic potential of fufural derivatives as renewable feedstocks (Hashmi *et al.*, 2006; Hashmi, Ata *et al.*, 2007) we investigated their possible transformation into bis-phenols in the gold-catalyzed phenol synthesis (Hashmi *et al.*, 2000), one of the numerous gold-catalyzed cycloisomerization reactions known today (Hashmi, 2004; Hashmi & Hutchings, 2006a,b; Hashmi, 2007). This crystal structure analysis now allows a unambiguous assignment of the different diastereomers formed in previous step, the organo-catalyzed benzoin condensation of fufurals, and in the subsequent step, the gold-catalyzed synthesis of the benzoid arene ring.

The molecule crystallizes with a half of the molecule in the asymmetric unit (Fig. 1). The inversion centre located in the middle of C6—C6A ($-x + 2, -y + 1, -z + 1$) generates the molecule having the chiral centres of opposite chirality, characteristic of a *meso*-form. The perfect coplanar orientation of the two symmetry-related furan rings is indicated by the angle of their best planes of 0.00 (12) $^{\circ}$. The alkynyl moieties show a parallel orientation to the best plane of the furan moieties with an angle of 2.48 (19) $^{\circ}$. The triple bond C8≡C9 is clearly characterized by the distance of 1.174 (3) Å. The packing diagram (Fig. 2) shows a linear intermolecular C9—H9···O2 contact with a H9···O2 distance of 2.39 Å between the alkynyl moiety and the ether function. A weak intermolecular C3—H3···O1 interaction with a H3···O1 distance of 2.87 Å between neighboring furan moieties along the direction of the *c* axis is observed.

Experimental

The compound was prepared by the reduction of 2-hydroxy-1,2-bis(5-methylfuran-2-yl)ethanone to the corresponding 1,2-diol and propargylation of the latter with propargyl bromide in the presence of a base as described in the literature (Hashmi, Wölflé *et al.*, 2007). The two diastereomers were separated by column chromatography on silica gel (PE-EtOAc-CH₂Cl₂, 30:1:2) as described there, the diastereomer eluting first crystallized by slow evaporation from a chloroform solution. ¹H NMR spectroscopic data of the pure diastereomer: ¹H NMR (300 MHz, CDCl₃): δ = 2.30 (d, *J* = 1.0 Hz, 6 H), 2.36 (t, *J* = 2.4 Hz, 2 H), 3.93 (dd, *J* = 15.9, 2.4 Hz, 2 H), 4.08 (dd, *J* = 15.9, 2.4 Hz, 2 H), 4.91 (s, 2 H), 5.95 (dq, *J* = 3.1, 1.0 Hz, 2 H), 6.33 (d, *J* = 3.1 Hz, 2 H).

Refinement

H atoms were located in difference Fourier map and refined with fixed individual displacement parameters [U(H) = 1.2U_{eq}(C) or U(H) = 1.5U_{eq}(C_{methyl})] using a riding model with C—H ranging from 0.93 to 0.97 Å. In addition, the methyl group was allowed to rotate but not to tip.

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.048$	$w = 1/[\sigma^2(F_o^2) + (0.07P)^2 + 0.237P]$ where $P = (F_o^2 + 2F_c^2)/3$
$wR(F^2) = 0.129$	$(\Delta/\sigma)_{\max} < 0.001$
$S = 1.06$	$\Delta\rho_{\max} = 0.22 \text{ e \AA}^{-3}$
1402 reflections	$\Delta\rho_{\min} = -0.21 \text{ e \AA}^{-3}$
102 parameters	Extinction correction: SHELXL97 (Sheldrick, 1997), $F_c^* = kF_c[1 + 0.001x F_c^2 \lambda^3 / \sin(2\theta)]^{1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.019 (5)
Secondary atom site location: difference Fourier map	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
