Received 30 September 2007; accepted 4 October 2007

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.044; wR factor = 0.145; data-to-parameter ratio = 21.9.

In the title compound, $\text{C}_{13}\text{H}_{14}\text{N}_2\text{O}_3$, the morpholine ring adopts the usual chair conformation. The crystal structure is stabilized by weak C—H···O hydrogen-bond interactions.

Comment

Morpholine is used as an important chemical intermediate in the preparation of pesticides. Drugs containing the morpholine ring have established activities that include the reduction of blood sugar and lipid levels (Yoshioka, 1995), and amelioration of obesity and insulin resistance (Fisher & Wyvatt, 1990). Owing to their pharmacological activities the morpholine derivatives have received a great deal of attention in respect of their synthesis and crystal structures. Phthalimides and N-substituted phthalimides are an important class of compounds because of their interesting biological activities (Lima *et al.*, 2002; Orzeszka *et al.*, 2000; Bailleux *et al.*, 1993).

Phthalimides have also served as starting materials and intermediates for synthesis of alkaloids (Couture *et al.*, 1998) and pharmacophores (Couture *et al.*, 1997).

The molecular structure of the title compound is illustrated in Fig. 1.

In the morpholine ring the average C—N, C—C and C—O bond distances [1.457 (2), 1.504 (2), 1.421 (2) Å] are in good agreement with earlier reports (Ramnathan *et al.*, 1996). The morpholine ring adopts the usual chair conformation. This is in good agreement with structural data available from version 5.14 of the Cambridge Structural Database (Allen, 2002). The geometry of the phthalimide ring system is close to that in the related compound 4-(1,3-dioxoisooindolin-2-yl)benzaldehyde (Liu *et al.*, 2004).

The sum of the angles around N1 is 358.60 (10)° indicating sp^2 hybridization. However the N1—C1 [1.399 (2) Å] and N1—C8 [1.402 (2) Å] distances are intermediate between the average C_{ar}—Nsp³(pyramidal) [1.419 (17) Å] and C_{ar}—Nsp²(planar) [1.353 (7) Å] distances reported by Allen *et al.* (1987).

The crystal structure is stabilized by weak C—H···O hydrogen bonds (Table 1).

Experimental

Phthalimide (14.7 g, 0.1 mole) taken in a 250 ml beaker was dissolved in 20 ml dimethylformamide and 9.5 ml of 37% (*w/v*) aqueous formaldehyde (0.1 mole) was added and stirred well. Morpholine (9.0 ml, 0.1 mole) was slowly added to the beaker with stirring. The clear solution became oily. The oily mixture on continuous stirring gave the colourless solid product. The solid product was washed with cold water and finally with diethyl ether. The crude product was recrystallized from ethanol. It melts at 114°C.

Refinement

All H atoms were refined with fixed individual displacement parameters [$U(H) = 1.2 U_{\text{eq}}(\text{C})$] using a riding model with C—H(aromatic) = 0.93 Å. The two methylene H atoms were freely refined.

3753 reflections $\Delta\rho_{\max} = 0.21 \text{ e } \text{\AA}^{-3}$
 171 parameters $\Delta\rho_{\min} = -0.19 \text{ e } \text{\AA}^{-3}$
 Primary atom site location: structure-invariant direct Extinction correction: none
 methods

Special details

Geometry. Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2 , conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating *R*-factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.
