Received 14 September 2007; accepted 9 October 2007

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(\text{C}-\text{C}) = 0.009$ Å; disorder in main residue; R factor = 0.049; wR factor = 0.153; data-to-parameter ratio = 7.5.

The title compound, $\text{C}_{40}\text{H}_{48}\text{O}_8$, is a derivative of gambogic acid, which is an effective telomerase inhibitor and displays potent anticancer activity both *in vitro* and *in vivo*. The three fused rings, *A*, *B* and *C*, are almost coplanar, with a mean deviation of 0.0670 (3) Å from their least-squares plane. The bridged structural unit including rings *D*, *E* and *G* forms a conformation like that of triethylenediamine. The structure is assembled *via* $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds. One methyl group is disordered over two positions; the site occupancy factors are *ca* 0.7 and 0.3.

Methyl 6-methoxygambogate

W. Liu, F. Feng, X. Wang, Q. Guo and Q. You

Comment

Garcinia L. Planch (e.g. *Garcinia hanburyi* Hook. and *Garcinia morella* Gesv.), is used in traditional Chinese medicine for detoxification, maintaining hemostasis, and as an anthelmintic. Gambogic acid (GBA), the primary component of Gamboge, is a prenylated xanthonoid that has the bridged structural moiety of tricyclo-4-oxa[4.3.1.0]decan-2-one. GBA is an effective telomerase inhibitor and displays potent anticancer activity both *in vitro* and *in vivo*. Moreover, GBA has been shown to induce apoptosis in a cell cycle independent manner. In order to study the structure–activity relationship of GBA, several derivatives were synthesized and showed potential antitumor activity. The title compound, 6-methoxy-methyl-gambogate, is a derivative of them (Liu *et al.*, 2004). We report here the crystal structure of (I).

The crystal structure of the title compound is shown in Fig. 1. The three fused rings A(O1/C1–C4/C9), B(C4–C9) and C(O2/C6/C7/C10–C12) is almost coplanar with mean deviation being 0.0670 (3) Å from their least square plane. Rings D(C10/C11/C13–C16), E(C13–C15/C17–C19) and G(C10/C13–C15/C18/C19) formed a conformation like triethylenediamine. Three chains including H(C34–C39/O7/O8), I(C27–C31) and J(C21–C26) exists in the compound. Chain H is almost planar indicated by the mean deviations being 0.0436 (2) Å from their least square plane, and it have a dihedral angle of 12.1 (6)° with the plane of the fused rings A, B and C. The double bond C35=C36 has a *syn* conformation with torsion angle C38–C35–C36–C37 being –177.1 (5)°.

The title compound is assembled *via* hydrogen bonds C2—H2⋯O8ⁱ and C31—H31C⋯O6ⁱⁱ [Symmetry code: (i) 1 – x, 1/2 + y, 1 – z; (ii) 1 – x, 1/2 + y, –z] as shown in Fig. 2. Details of the hydrogen bonds geometry is shown in Table 1.

Experimental

Gambogic acid (100 mg) dissolved in acetone (10 ml), anhydride K₂CO₃ (300 mg) and iodomethane (1 ml) was added and stirred at room temperature for a week. Inpoured the reagent into water (10 ml), and extracted with ether (60 ml) for 3 times. The ether layer was evaporated after being washed by water and dried with anhydride Na₂SO₄. The residue was separated by silica chromatography, 6-methoxyl-methyl-gambogate (30 mg) was isolated as yellow needles. The title compound was dissolved in ethanol to get saturated solution, the cube crystals were obtained after a week's standing.

Refinement

The positions of the H atoms of the hydroxyl groups were located initially in a difference Fourier map and then constrained to ride on the parent O atom with O—H = 0.82–0.85, $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$. The methyl H atoms were constrained to an ideal geometry with C—H = 0.96 Å and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$, but were allowed to rotate freely about the C—C bonds. All remaining H atoms were placed in geometrically idealized positions (C—H = 0.93–0.97 Å) and constrained to ride on their parent atoms with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$. Friedel pairs were averaged before the final refinement as the absolute could not be determined unambiguously.

Figures

Fig. 1. A view of the asymmetric unit of the title compound, showing the atom-labeling scheme. Displacement ellipsoids are drawn at the 30% probability level. H-atoms are shown as spheres of arbitrary radii.

Fig. 2. Part of the packing diagram of the title compound shown the C—H...O hydrogen bonds. Atoms marked with (i) and (ii) are at the symmetric position of $(1 - x, 1/2 + y, 1 - z)$ and $(1 - x, 1/2 + y, -z)$, respectively. Some H atoms are omitted for the sake of clarity.

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.049$	$w = 1/[\sigma^2(F_o^2) + (0.0745P)^2 + 0.3642P]$
$wR(F^2) = 0.153$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.05$	$(\Delta/\sigma)_{\max} < 0.001$
3235 reflections	$\Delta\rho_{\max} = 0.32 \text{ e } \text{\AA}^{-3}$
432 parameters	$\Delta\rho_{\min} = -0.47 \text{ e } \text{\AA}^{-3}$
125 restraints	Extinction correction: none
Primary atom site location: structure-invariant direct methods	Absolute structure: Flack (1983), with how many Friedel pairs?
Secondary atom site location: difference Fourier map	Flack parameter: ?

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
