Received 8 October 2007; accepted 10 October 2007

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$;
 R factor = 0.045; wR factor = 0.119; data-to-parameter ratio = 13.3.

The title compound, $\text{C}_{22}\text{H}_{15}\text{FO}$, is the first example of a crystallographically characterized fully substituted fluorofuran. Although the F atom does not appear to participate in aryl- π attractions or classical hydrogen bonding, the title compound does contain four unique intermolecular π - π stacking interactions that have an atom-to-centroid range of 3.53 (4)–3.64 (4) \AA . The phenyl ring located between the F and O atoms is only 9.55 (7) $^\circ$ from being coplanar with the furan ring, whereas the other aromatic planes form angles of 41.71 (1) and 20.45 (1) $^\circ$ with the ring.

3-Fluoro-2,4,5-triphenylfuran

J. M. Jacobsen, S. Arimitsu, G. B. Hammond and M. S. Mashuta

Comment

The furan ring system is a critical structural moiety of a variety of natural products, active pharmaceuticals, agricultural compounds, and synthetic precursors. One particularly underdeveloped area of furan chemistry is the synthesis of fluorine containing systems. This is exceptionally puzzling due to the interesting pharmokinetic properties fluorine can instill into the parent molecule (Uneyama, 2006; Schlosser, 1998; Hammond, 2005). Recently, our group reported the facile, indium mediated synthesis of α,α -difluorohomopropargyl alcohols (Arimitsu & Hammond, 2006; Arimitsu *et al.*, 2007). The synthetic usefulness of these alcohols in heterocyclizations was demonstrated with a silver catalyzed synthesis of 3-fluoro-2,5-disubstituted furans. If an electrophile could be trapped using this methodology it could provide a critical synthetic handle at the 4-position of the fluorofurans, which in turn could provide ready access to hitherto unknown 3-fluoro-2,4,5-trisubstituted furans such as the title compound.

A search of the Cambridge crystallographic database revealed that the title compound represents the first structurally characterized fully substituted fluorofuran (Allen, 2002). The atomic labelling scheme is shown in Fig. 1 (*ORTEP-3*, Farrugia, 1997) and a partial packing diagram (Fig. 2) identifies the aromatic rings involved in the intermolecular π stacking analysis (Janiak, 2000). Neighboring five-membered furan rings are involved in two intermolecular $\pi\cdots\pi$ stacking interactions along the crystallographic *a* axis. The first slipped stack interaction between furan rings is 3.61 (4) Å, between C2 at (*x*, *y*, *z*) and the centroid of the five-membered ring at (*x* + 1/2, *y*, 1/2 - *z*). There is a second slipped π stack interaction of 3.64 (4) Å from C1 at (*x* + 1/2, *y*, 1/2 - *z*) to the centroid of the furan ring at (*x*, *y*, *z*). There are also two slipped π stack intermolecular interactions formed between the phenyl group containing C5—C10 (Ph1) at (*x*, *y*, *z*) with the phenyl group containing C17—C22 (Ph3) of the neighboring molecule at (*x* + 1/2, *y*, 1/2 - *z*). The intermolecular C7 (*x*, *y*, *z*) to C17—C22 centroid distance is 3.53 (4) Å. The second intermolecular interaction of 3.64 (4) Å is between C17 (*x* + 1/2, *y*, 1/2 - *z*) and the C5—C10 centroid.

The fluorine atom sits (dev 0.007 (1) Å) in the same plane as the furan ring, which has a mean deviation of 0.009 (1) Å. The F1—H6 non-bonded contact is 2.416 (17) Å with a F1···C6 separation of 3.0814 (17) Å and the C6—H6···F1 angle is 126.3 (4)°. The O1···H10 non-bonded contact is 2.491 (17) Å with a O1···C10 separation of 2.8250 (16) Å and the C10—H10···O1 angle is 99.0 (4)°. Neither is representative of a classical intramolecular hydrogen bond (Desiraju, 1995). It is however noteworthy that the C5—C10 phenyl plane (dev 0.001 (1) Å), located between F1 and O1, is only 9.55 (7)° from being coplanar with the furan ring, whereas the C11—C16 (dev 0.008 (1) Å) and the C17—C22 (dev 0.004 (1) Å) aromatic planes form angles of 41.71° and 20.45°, respectively, with the five-membered furan ring. The x-ray structure of the related complex 3-fluoro-2-(4-methoxyphenyl)-5-phenylfuran previously reported (Xu & Chen, 2003; CSD refcode HACYUG) contains two aromatic substituents and shows similar π stacking interactions to the title compound. Interestingly, the methoxyphenyl group located at position 2 of the furan ring in this compound is also nearly coplanar (angle of 1.99°) with the furan plane. The fact that the only two crystal structures known for fluorofurans both show this coplanarity may suggest the possibility of an F···H interaction, but this needs to be proven with more structurally related analogues.

supplementary materials

Experimental

To a microwave vial were added Pd(PPh₃)₄ (23.1 mg, 0.02 mmol), benzene boronic acid (97.5 mg, 0.8 mmol), 3-fluoro-4-iodo-2,5-diphenyl-furan (74.4 mg, 0.2 mmol) in 4.0 ml of toluene, 0.4 ml EtOH, and 0.4 ml of aq. 2M Na₂CO₃. The vial was capped and purged with argon before microwave irradiation (388 K, 30 min). Column chromatography (neat hexane/silica) yielded the title compound (63.0 mg, 98%). Crystals for X-ray analysis were obtained upon slow evaporation of a hexane solution of the title compound at room temperature.

Refinement

Phenyl hydrogen atoms were located from difference maps and refined isotropically. C—H Bond distances range from 0.958 (17) Å to 1.01 (2) Å with an average of 0.977 (19) Å. The highest peak, 0.59 e/Å³, and deepest trough, −0.24 e/Å³, are located 1.53 Å from O1 and 0.46 Å from F1, respectively.

Figures

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.045$	All H-atom parameters refined
$wR(F^2) = 0.119$	$w = 1/[\sigma^2(F_o^2) + (0.0604P)^2 + 1.6834P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.06$	$(\Delta/\sigma)_{\text{max}} < 0.001$
3687 reflections	$\Delta\rho_{\text{max}} = 0.59 \text{ e \AA}^{-3}$
277 parameters	$\Delta\rho_{\text{min}} = -0.24 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Experimental. Data were collected with a Bruker SMART APEX CCD-based diffractometer using ω -scans of width 0.3° and 30 s duration at a crystal-to-detector distance of 4.908 cm. Intensity decay over the course of the data collection was evaluated by recollecting the first 50 frames of data at the end of the experiment. No significant decay was noted.
