Received 11 October 2007; accepted 16 October 2007

Key indicators: single-crystal X-ray study; $T = 295$ K; mean $\sigma(\text{C}-\text{C}) = 0.007$ Å; R factor = 0.037; wR factor = 0.099; data-to-parameter ratio = 14.9.

In the title molecule, $\text{C}_{16}\text{H}_{11}\text{Br}_3\text{Cl}_2\text{O}_2$, the chain Br atoms are in *trans* positions [Br—C—C—Br torsion angle is 179.0 (2°)]. The two benzene rings make a dihedral angle of 39.54 (15°). The crystal packing is determined by van der Waals forces; some weak π – π interactions between the benzene rings of neighbouring molecules are also possible [the distance between their centroids is 3.753 (5) Å]. Intermolecular C—H...Br interactions are also present.

2,3-Dibromo-3-(5-bromo-2-methoxyphenyl)-1-(2,4-dichlorophenyl)propan-1-one

B. Narayana, A. N. Mayekar, H. S. Yathirajan, B. K. Sarojini and M. Kubicki

Comment

For a structurally simple group of compounds, chalcones display an impressive array of biological activities, among which antimalarial (Liu *et al.*, 2003), antiprotozoal (Nielsen *et al.*, 1998), nitric oxide inhibition (Rojas *et al.*, 2002) and anti-cancer activities have been reported in the literature. Among several organic compounds reported for non-linear optical (NLO) properties, chalcone derivatives are notable materials for their excellent blue light transmittance and good crystallizability (Indira *et al.*, 2002; Sarojini *et al.*, 2006). They provide a necessary configuration to show NLO properties, with two planar rings connected through a conjugated double bond. The substitution of a bromo group on either of the phenyl rings greatly influences the non-centrosymmetric crystal packing. The bromo group can obviously improve the molecular first-order hyperpolarizabilities and can effectively reduce dipole - dipole interactions between the molecules. Chalcone derivatives usually have a lower melting temperature, which can be a drawback when we use these crystals in optical instruments, but chalcone dibromides usually have higher melting points and are thermally stable. A new chalcone dibromide (**1**), C₁₆H₁₂Br₂Cl₂O₂, was prepared by the bromination of the chalcone, (2*E*)-1-(2,4-Dichlorophenyl)-3-(2-methoxyphenyl)prop-2-en-1-one. During the bromination process the excess bromine reacted with the dibromide to form 2,3-dibromo-3-(5-bromo-2-methoxyphenyl)-1-(2,4-dichlorophenyl) propan-1-one (**1**). Due to the space group symmetry, the racemic mixture is present in the crystal structure.

The conformation of **1** (Fig. 1) can be described by the torsion angles between two approximately planar benzene rings with maximum deviations from mean planes of 0.009 (3) Å and 0.019 (3) Å for the rings C11 - C16 (A) and C31 - C36 (B), respectively, and the central C1—C2—C3 bridge (C). The values of these angles: A/B 39.54 (15)°, A/C 56.8 (3)°, and B/C 44.4 (3)° show that the rings are twisted in opposite sense with respect to the central bridge. The bromine Br2 and Br3 atoms are in mutual *trans* position, the torsion angle Br2—C2—C3—Br3 is 179.0 (2)°. The C—Br distances for C(sp³) and C(sp²) carbon atoms are significantly different: 2.007 (5)Å and 2.018 (5)Å for the former and 1.898 (5)Å for the latter.

In the crystal structure, besides the van der Waals forces (Fig. 2) there are also some C···C short contacts between neighbouring benzene rings: C14···C14(1 - x, -y, 1 - z) of 3.429 (3)Å and C34···C36(-x, -y, -z) of 3.349 (3) Å. Only in the latter case, however, there is an overlap between the rings with the short distance of 3.753 (5) Å between their centroids, thus only in this case some π-π interaction is possible. Additionally, some directional weak C—H···Br interactions (Table 1) can be important. Short contact C112···Br2(x, 1 + y, z) of 3.590 (5) Å is observed within the chains of molecules along [010] direction.

Experimental

(2*E*)-1-(2,4-Dichlorophenyl)-3-(2-methoxyphenyl)prop-2-en-1-one (3.07 g, 0.01 mol) was treated with bromine in acetic acid (30%) until the orange colour of the solution persisted. After stirring for half an hour, the content was poured on to crushed ice. The resulting solid mass was collected by filtration. The compound was dried and recrystallized from ethanol. Crystals suitable for structure determination were obtained from ethyl acetate by slow evaporation (yield 70%; m.p. 385–388 K). Analysis for C₁₆H₁₁Br₃Cl₂O₂ found (calculated): C: 35.12 (35.20), H: 1.99% (2.03%).

Refinement

The hydrogen atoms were placed in the idealized positions (C—H 0.93–0.98 Å) and refined using a riding model approximation, with $U_{\text{iso}}(\text{H})=1.2$ or $1.3 U_{\text{eq}}(\text{C})$.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.037$	H-atom parameters constrained
$wR(F^2) = 0.099$	$w = 1/[\sigma^2(F_o^2) + (0.05P)^2]$
$S = 1.20$	where $P = (F_o^2 + 2F_c^2)/3$
3104 reflections	$(\Delta/\sigma)_{\max} < 0.001$
209 parameters	$\Delta\rho_{\max} = 0.70 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\min} = -0.62 \text{ e } \text{\AA}^{-3}$
	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
