Key indicators: single-crystal X-ray study;  $T = 294$  K; mean  $\sigma(\text{C}-\text{C}) = 0.005$  Å;  $R$  factor = 0.054;  $wR$  factor = 0.157; data-to-parameter ratio = 13.8.

In the title compound,  $\text{C}_{15}\text{H}_{13}\text{ClO}_3$ , the vanillin group makes a dihedral angle of  $72.79$  ( $9$ ) $^\circ$  with the chlorobenzene ring. The crystal structure is stabilized by weak non-classical intermolecular  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds that form centrosymmetric dimers.

## 4-(4-Chlorobenzoyloxy)-3-methoxybenzaldehyde

S.-X. Liu, X. Tian, X.-L. Zhen, Z.-C. Li and J.-R. Han

### Comment

There has been a steady growth of interest in the synthesis, structure, and reactivity of Schiff bases due to their potential applications in areas such as biological modelling, catalysis, and molecular magnets (Jones *et al.*, 1979; Larson & Pecoraro, 1991). Consequently, a significant effort has been devoted to the synthesis of new Schiff base derivatives (Santos *et al.*, 2001).

As a part of our interest in the coordination properties of Schiff bases functioning as ligands, we investigated the title compound, (I), used as a precursor in the preparation of Schiff bases.

In the title molecule (Fig. 1), bond lengths and angles are within normal ranges (Allen *et al.*, 1987). The vanillin group (C1—C6/C8/O1/O2) is essentially planar, with an r.m.s. deviation for fitted atoms of 0.0090 Å. This group makes a dihedral angle of 72.79 (9)° with the benzene ring (C10—C15).

The crystal structure is stabilized by weak non-classical intermolecular C14—H14···O2 hydrogen bonds that forms centrosymmetric dimers (Table 1, Fig. 2).

### Experimental

An anhydrous acetonitrile solution (50 ml) of 4-hydroxy-3-methoxybenzaldehyde (1.52 g, 10 mmol) was added dropwise to a solution (100 ml) of 1-(bromomethyl)-4-chlorobenzene (2.05 g, 10 mmol) and potassium carbonate (1.38 g, 10 mmol) in acetonitrile, in 30 min., and the mixture refluxed for 48 h under nitrogen atmosphere. The solvent was removed and the resultant mixture poured into ice-water (100 ml). The white precipitate was then isolated and recrystallized from acetonitrile, and then dried in a vacuum to give the pure compound in 65% yield. Colorless single crystals of (I) suitable for X-ray analysis were obtained by slow evaporation of an acetonitrile solution.

### Refinement

The H atoms were included in calculated positions and refined using a riding model approximation. Constrained C—H and N—H bond lengths and isotropic U parameters: 0.93 Å and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  for  $\text{Csp}^2\text{—H}$ ; 0.97 Å and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  for methylene C—H; 0.96 Å and  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$  for methyl C—H.

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
