Received 10 November 2007; accepted 12 November 2007

Key indicators: single-crystal X-ray study; $T = 295$ K; mean $\sigma(C-C) = 0.005$ Å; R factor = 0.043; wR factor = 0.142; data-to-parameter ratio = 15.9.

In the title complex, $[Co(C_{16}H_{10}O_4)(C_{12}H_8N_2)(H_2O)_2]_n$, the Co^{II} ion exists in an octahedral geometry, coordinated by two N atoms of a 1,10-phenanthroline ligand, two carboxylate O atoms of two different *trans*-stilbene-4,4'-dicarboxylate ligands and two water molecules. The *trans*-stilbene-4,4'-dicarboxylate bridges give rise to a linear chain structure. These chains are further interconnected through intermolecular hydrogen bonds and π - π stacking interactions between one of the rings of the 1,10-phenanthroline ligand and a symmetry-related ring [centroid-to-centroid distance 3.6153 (8) Å], to form a three-dimensional supramolecular network.

catena-Poly[[diaqua(1,10-phenanthroline- κ^2N,N')cobalt(II)]- μ -*trans*-stilbene-4,4'-dicarboxylato- $\kappa^2O:O'$]

H.-Y. Wang, S. Gao, L.-H. Huo and J.-G. Zhao

Comment

Many new complexes have been synthesized using polycarboxylates to combine with specific transition metal ions by introducing neutral N-heterocyclic ligands (Wang *et al.*, 2004; Wang, Qin *et al.*, 2006). We report here the synthesis and structure of a new one-dimensional cobalt complex (Fig. 1).

The complex is an infinite one-dimensional chain polymer with a Co^{II} ion, two half of *trans*-stilbene-4,4'-dicarboxylato ligands, a 1,10-phenanthroline and two coordinated water molecules in the asymmetric unit. Each Co^{II} ion is in a distorted octahedral geometry. The $[\text{Co}(1,10\text{-phenanthroline})(\text{H}_2\text{O})_2]$ units are connected by *trans*-stilbene-4,4'-dicarboxylato bridges with bis-dentate mode to form an one-dimensional zigzag chain structure. The chains are further interconnected through intermolecular hydrogen bonds and π - π stacking interactions between one of the rings of the 1,10-phenanthroline ligand (C7–C10/N2/C11) and symmetry-related ring at $(1-x, 2-y, 1-z)$, with a centroid-to-centroid distance of 3.6153 (8) Å into three-dimensional supramolecular network (Table 2 and Fig. 2). The structure contains voids of about 105.00 Å³ and there is no solvent molecules occupied.

Experimental

A mixture of $\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$ (1 mmol), 1,10-phenanthroline (1 mmol), *trans*-stilbene-4,4'-dicarboxylic acid (1 mmol) and water (10 ml) was stirred for 15 min in air, then transferred and sealed in a 23 ml Parr teflon-lined stainless steel vessel, heated to 160 ° for 5 days, and then cooled to room temperature. The resulting red crystals were filtered, washed, and dried in air. Analysis calculated for $\text{C}_{28}\text{H}_{22}\text{CoN}_2\text{O}_6$: C 62.12, H 4.10, N 5.17%; found: C 62.14, H 4.13, N 5.15%.

Refinement

The H atoms were placed in calculated positions with C—H = 0.93 or 0.97 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ and were included in the refinement in the riding model approximation. The H atoms of hydroxyl groups were located in difference Fourier maps and refined with the O—H distance restrained to 0.85 (1) Å and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$.

Figures

Fig. 1. Molecular structure of the title compound. Dashed lines indicate O—H...O hydrogen bonds.

Fig. 2. The packing diagram of the title complex, with the hydrogen bonds denoted by dashed lines.

 346 parameters $\Delta\rho_{\min} = -0.48 \text{ e } \text{\AA}^{-3}$
 6 restraints Extinction correction: none
 Primary atom site location: structure-invariant direct methods

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
