Received 24 October 2007; accepted 19 November 2007

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.028; wR factor = 0.069; data-to-parameter ratio = 20.1.

The reaction of cadmium(II) nitrate tetrahydrate with the proton-transfer compound piperazinium pyridine-2,5-dicarboxylate, or $(\text{pipzH}_2)(\text{py}-2,5\text{-dc})\cdot 2\text{H}_2\text{O}$ (in which pipz is piperazine and py-2,5-dcH₂ is pyridine-2,5-dicarboxylic acid), in aqueous solution (molar ratio 1:2) leads to the formation of the title compound, $(\text{C}_4\text{H}_{12}\text{N}_2)_{1.5}[\text{Cd}(\text{C}_7\text{H}_3\text{NO}_4)_2(\text{C}_7\text{H}_4\text{NO}_4)]\cdot 3\text{H}_2\text{O}$ or $(\text{pipzH}_2)_{1.5}[\text{Cd}(\text{py}-2,5\text{-dc})_2(\text{py}-2,5\text{-dcH})]\cdot 3\text{H}_2\text{O}$. The anion is a six-coordinate complex with a distorted octahedral geometry around Cd^{II}. Extensive intermolecular O—H...O, N—H...O and C—H...O hydrogen bonds involving the $(\text{py}-2,5\text{-dc})^{2-}$ ligand, $(\text{pipzH}_2)^{2+}$ as counter-ion and the uncoordinated water molecules connect the various components into a supramolecular structure.

Sesqui(piperazinediium) (5-carboxypyridine-2-carboxylato)bis(pyridine-2,5-dicarboxylato)cadmate(II) trihydrate

H. Aghabozorg, Z. Derikvand, A. Nemati, M. Ghadermazi and J. Attar Gharamaleki

Comment

We have previously reported some proton transfer systems, using pyridine-2,6-dicarboxylic acid (pydcH₂), pyridine-2,5-dicarboxylic acid (py-2,5-dcH₂) and piperazine (pipz) which have formed the proton transfer compounds (pipzH₂)(pydcH)₂·3H₂O and (pipzH₂)(py-2,5-dc)·2H₂O. The crystal structures of some complexes of these systems have been reported (Aghabozorg, Attar Gharamaleki *et al.*, 2007; Aghabozorg, Daneshvar *et al.*, 2007; Aghabozorg, Motyeian *et al.*, 2007). We describe here the crystal structure of the title compound which consists of monomeric units in which the (pipzH₂) units act as counter ions and the (py-2,5-dc)²⁻ anions as bidentate ligands. The N3—Cd1—O1 [145.97 (5)°], O5—Cd1—O9 [152.50 (5)°], N2—Cd1—N1 [133.16 (5)°] angles show that the coordination environment around Cd^{II} is distorted octahedral (Table 1 and Fig.1). There are a large number of O—H···O, N—H···O and C—H···O hydrogen bonds with distances ranging from 2.439 (2) Å to 3.327 (2) Å between water molecules, piperazindium and pyridine-2,5-dicarboxylate fragments (Table 2). These interactions as well as C—H···π interactions between C—H groups and aromatic rings of pyridine-2,5-dicarboxylate with distances of 3.224 and 3.473 Å result in the formation of supramolecular structure (Fig. 2 and Fig. 3).

Experimental

The reaction of (pipzH₂)(py-2,5-dc)·2H₂O (200 mg, 0.797 mmol) (Sheshmani *et al.*, 2007) in water (20 ml) with Cd(NO₃)₂·4H₂O (122.2 mg, 0.477 mmol) in water (20 ml) gave yellow crystals of the title compound. Crystals were obtained by slow evaporation of the solvent at room temperature.

Refinement

The hydrogen atoms of NH₂, OH groups and water molecules were found in difference Fourier synthesis. The H(C) atom positions were calculated. All hydrogen atoms were refined in isotropic approximation in riding model with with the $U_{iso}(H)$ parameters equal to 1.2 $U_{eq}(C_i)$, 1.2 $U_{eq}(N_i)$ and 1.2 $U_{eq}(O_i)$ where $U(C_i)$, $U(N_i)$, $U(O_i)$ are respectively the equivalent thermal parameters of the carbon, nitrogen and oxygen atoms to which corresponding H atoms are bonded.

Figures

Fig. 1. Molecular structure of the title compound, with displacement ellipsoids drawn at 50% probability level. Hydrogen atoms shown as small spheres.

Fig. 2. The crystal packing as viewed down the b direction. Hydrogen bonds are shown as dashed lines.

Fig. 3. C—H... π stacking interactions between C—H groups and aromatic rings of (py-2,5-dc)²⁻ units. The C—H... π distances (measured to the centre of phenyl ring) are 3.224 and 3.473 Å, respectively.

Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\min} = -0.64 \text{ e } \text{\AA}^{-3}$
	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
