Received 25 October 2007; accepted 30 October 2007

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$ ;  
 disorder in main residue;  $R$  factor = 0.042;  $wR$  factor = 0.106; data-to-parameter  
 ratio = 15.2.

In the molecule of the title compound,  $\text{C}_{20}\text{H}_{20}\text{Br}_2\text{N}_4\text{O}_7$ , one ethyl group is disordered over two positions; site-occupation factors were fixed at 0.63 and 0.37. The non-planar seven- and six-membered rings adopt chair conformations, while the two five-membered rings have envelope conformations. In the crystal structure,  $\text{C}-\text{H}\cdots\text{O}$  and  $\text{C}-\text{H}\cdots\text{Br}$  hydrogen bonds result in the formation of a tape-like structure.

**Comment**

Diethoxycarbonyl glycoluril bearing a range of electron withdrawing functional groups on its convex face is an important building block for both molecular and supramolecular chemistry (Burnett *et al.*, 2003). The title compound, (I), derived from diethoxycarbonyl glycoluril is an important intermediate for methylene-bridged glycoluril dimers. We report herein its crystal structure.

In the molecule of (I) (Fig. 1), the ligand bond lengths and angles (Table 1) are within normal ranges (Allen *et al.*, 1987).

When the crystal structure was solved, the atoms C15, H15A, H15B, C16, H16A, H16B and H16C were found to be disordered.

Rings B (N1/N2/C1/C2/C7/C8/C13) and E (N3/N4/O3/C11/C12/C17) are not planar, having total puckering amplitudes,  $Q_T$ , of 2.312 (3) and 1.267 (2) Å, respectively. They adopt chair conformations [ $\phi = 108.31$  (2)° and  $\theta = 4.40$  (3)° (for ring E)] (Cremer & Pople, 1975). Rings C and D have envelope conformations with atoms C9 and C10 displaced by −0.207 (3) Å and −0.246 (2) Å from the planes of the other ring atoms, respectively. Ring A (C1—C6) is, of course, planar.

In the crystal structure, C—H···O and C—H···Br hydrogen bonds (Table 2, Fig. 2) result in the formation of a tape-like structure, in which they may be effective in the stabilization of the structure.

**Experimental**

The title compound was synthesized according to the procedure reported (Wu *et al.*, 2002). Crystals appropriate for X-ray analysis were obtained by slow evaporation of the dichloromethane solution at 283 K.

**Refinement**

When the crystal structure was solved, the atoms C15, H15A, H15B, C16, H16A, H16B and H16C were found to be disordered. During refinement, the occupancies of disordered C and H atoms were kept fixed as C15 = 0.63, C15' = 0.37, C16 = 0.63, C16' = 0.37, H15A = 0.63, H15C = 0.37, H15B = 0.63, H15D = 0.37, H16A = 0.63, H16D = 0.37, H16B = 0.63, H16E = 0.37, H16C = 0.63 and H16F = 0.37. H atoms were positioned geometrically with C—H = 0.93, 0.97 and 0.96 Å for aromatic, methylene and methyl H atoms, respectively, and constrained to ride on their parent atoms, with  $U_{\text{iso}}(\text{H}) = xU_{\text{eq}}(\text{C})$ , where  $x = 1.5$  for methyl H and  $x = 1.2$  for all other H atoms.

40 restraints	Absolute structure: Flack (1983), with 2108 Friedel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: 0.019 (10)
Secondary atom site location: difference Fourier map	

## *Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
