Received 9 November 2007; accepted 12 November 2007

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(\text{C}-\text{C}) = 0.004$ Å; R factor = 0.038; wR factor = 0.102; data-to-parameter ratio = 10.3.

The title compound, $\text{C}_{27}\text{H}_{33}\text{N}_3\text{O}_7$, isolated from the marine-derived fungus *Aspergillus sydowi* and also known as verruculogen, contains six fused rings. The indole portion of the molecule adopts a planar conformation with a maximum deviation of 0.022 (2) Å. The six-membered ring with one N atom has a half-chair conformation, the six-membered ring with two N atoms has a boat conformation and the terminal five-membered ring has an envelope conformation. There is an intramolecular hydrogen bond between a hydroxyl group and a carbonyl O atom. Further $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds link the molecules, forming a one-dimensional chain extending along the a axis.

Comment

TR-2, C₂₇H₃₃O₇, (I), was first isolated from the metabolites of *Penicillium verruculosum* (Cole *et al.*, 1972). This title compound (and related ones) arise from their biological activities (Cockrum *et al.*, 1979; Dowd *et al.*, 1988; Selala *et al.*, 1991; Cui *et al.*, 1996; Geris *et al.*, 2002; Bungler *et al.*, 2004). We isolated (I) as a part of our ongoing study characterizing bioactive metabolites from various marine derived microorganism. This paper reports the X-ray crystallographic study of (I).

As shown in Fig. 1, there is an intramolecular hydrogen bond between a hydroxyl (O6) and carbonyl oxygen atom (O4). The indole portion (N1, C1, C11 to C17) of the molecule adopts a planar conformation with the maximum deviation being 0.022 (2) Å (for atom C1). The six-membered N2—C2—C1—C11—C10—C9 ring takes on a half-chair conformation, the six-membered N2—C3—C4—N3—C8—C9 ring adopts a boat conformation, and the five-membered N3—C4—C5—C6—C7 ring takes on an envelope conformation. The corresponding puckering parameters (Cremer & Pople, 1975) are Q = 0.479 (3) Å, θ = 70.1 (4)°, φ = 270.8 (4)°; Q = 0.484 (4) Å, θ = 99.3 (4)°, φ = 124.9 (4)° and Q = 0.367 (4) Å, φ = 257.2 (6)°. The hydroxyls on atom C9 and C10 are *cis*-conformation. The —C(H)=CMe₂ side arm is approximately perpendicular to this plane, as seen in the values of the C17—N1—C18—C19 and C1—N1—C18—C19 torsion angles of 77.1 (3) and −92.3 (3)°, respectively.

In the crystal structure, the molecules interact with each other *via* O—H...O hydrogen bonds (Table 2) to form a 1-D chain along the *a* axis (Fig. 2).

Experimental

The isolated fugal strain *Aspergillus sydowi* PFW-13, was isolated from drift wood collected on the beach of Baishamen, Hainan, China. The working strain was cultured under static conditions at 303 K for 40 days in one hundred and fifty 1000-ml conical flasks containing the liquid medium (300 ml/flask) composed of maltose (20 g/L), mannitol (20 g/L), glucose (10 g/L), monosodium glutamate (10 g/L), KH₂PO₄ (5 g/L), MgSO₄ (0.3 g/L), yeast extract (3 g/L), corn steep liquor (1 g/L) and sea-water after adjusting its pH to 7.0. The fermented whole broth (45 liters) was filtered through cheese cloth to separate into supernatant and mycelia. The former was concentrated under reduced pressure to about a quarter of the original volume and then extracted three times with ethyl acetate to give an ethyl acetate solution, while the latter was extracted three times with acetone. The acetone solution was concentrated under reduced pressure to afford an aqueous solution, which was extracted three times with ethyl acetate to give a second ethyl acetate solution. Both ethyl acetate solutions were combined and concentrated under reduced pressure to give a crude extract (86.7 g) which was subjected to chromatography over silica gel column using a stepwise gradient elution of CHCl₃-petroleum ether (0–100%) and then MeOH-CHCl₃ (0–50%), to yield eighteen fractions (Fr.1-Fr.18). The fraction 11, eluted with chloroform: methanol 99:1, was further purified into 12 subfractions (Fr.11–1-Fr.11–12) by another silica gel column using a step gradient elution of petroleum ether:acetone. The

supplementary materials

title compound (9 mg) was purified by extensive preparative HPLC using MeOH-H₂O from Fr.11–3. The single crystals were obtained by slow evaporation of CHCl₃–MeOH (1:1) solution at 299 K.

Refinement

All H atoms were positioned geometrically and allowed to ride on their parent atoms at distances of 0.93–0.98 (C–H) and 0.82 Å (O–H), and with $U_{\text{iso}}(\text{H})$ values of $1.2U_{\text{eq}}(\text{C})$ and $1.5U_{\text{eq}}(\text{C}_{\text{methyl}}, \text{O})$. As mentioned above, the absolute configuration could not be determined crystallographically and Friedel pairs were merged.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
