Received 21 November 2007; accepted 22 November 2007

Key indicators: single-crystal X-ray study;  $T = 170\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$ ;  
 $R$  factor = 0.036;  $wR$  factor = 0.096; data-to-parameter ratio = 20.1.

The crystal structure of the title compound,  $[\text{ZnCl}_2(\text{C}_{10}\text{H}_8\text{N}_2\text{S})]$ , consists of a six-membered chelate ring in which the Zn atom is approximately tetrahedrally coordinated by two chloride ions and by the two pyridyl N atoms of a single di-2-pyridyl sulfide ligand. As usual for this type of complex, the sulfide group does not participate in zinc coordination. The dihedral angle between the two pyridine rings is  $50.4(1)^\circ$ .

## Dichlorido(di-2-pyridyl sulfide- $\kappa^2N,N'$ )zinc(II)

**M. Wriedt, I. Jess and C. Näther**

### Comment

Recently, we are interested in the synthesis, structures and thermal properties of coordination polymers based on zinc(II) halides and N-donor ligands (Bhosekar *et al.*, 2007). We have found for example that most of the ligand rich compounds can be transformed into ligand deficient compounds on heating. Starting from these findings we have initiated systematic investigations on this topic. In these investigations we have reacted zinc(II) chloride with 2,2'-bipyridyldisulfide. In this reaction, simultaneously a cleavage of the S—S bond takes place leading to the formation of di-2-pyridyl sulfide (dps). In further reaction with zinc(II) chloride the title compound (**I**) is formed. To identify this product in further reaction by X-ray powder diffraction, a structure determination was performed.

In general dps is a versatile ambidentate ligand that, due to its conformational flexibility, can act in N,N'-bidentate (Tresoldi *et al.*, 1992; Kondo *et al.*, 1995 and Nicolò *et al.*, 1996) or bridging (Tresoldi *et al.*, 1991 and Teles *et al.*, 1999) coordination modes toward many metals, resulting in complexes with different stereochemistry. When dps is bonded to the metal as a chelate ligand, a six-membered ring in boat conformation is formed, differently from its rigid analogues 2,2'-bipyridine that generates a pentacyclic chelate in a planar arrangement. In addition, in some cases dps can act as tridentate ligand in a N,N,S-coordination mode involving metal-sulfur interactions (Anderson & Steel, 1998).

In the crystal structure the coordination geometry about the Zn(II) ion is approximately tetrahedral with bonds being formed to two chloride ions and the two pyridyl nitrogen atoms of a single dps ligand (Fig. 1). These latter interactions result in the formation of a six-membered chelate ring, which is in a boat conformation. The angles at Zn(II) range from 93.85 to 115.66°, the largest being N—Zn—Cl. The Zn—Cl and Zn—N distances are in the range of 2.057 (2)—2.061 (2) and 2.2192 (8)—2.2261 (8) Å. The structural parameters in the dps molecule are quite regular. In particular the C—S bonds, 1.782 (3) and 1.780 (3) Å, are in good agreement with those expected for C(sp<sup>2</sup>)-S bonds (1.77 Å).

### Experimental

ZnCl<sub>2</sub> and 2,2'-bipyridyldisulfide was obtained from Alfa Aesar and methanol was obtained from Fluka. 0.0313 mmol (4.3 mg) zinc(II) chloride, 0.125 mmol (27.5 mg) 2,2'-bipyridyldisulfide and 3 ml of methanol were transferred in test-tube, which were closed and heated to 110 °C for three days. On cooling colourless block-shaped single crystals of (**I**) are obtained.

### Refinement

All H atoms were located in difference map but were positioned with idealized geometry and were refined isotropic with  $U_{\text{eq}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  of the parent atom using a riding model with C—H = 0.97 Å.

Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation
$a = 12.1944 (12) \text{ \AA}$	$\lambda = 0.71073 \text{ \AA}$
$b = 7.6404 (4) \text{ \AA}$	Cell parameters from 7174 reflections
$c = 14.2572 (15) \text{ \AA}$	$\theta = 3\text{--}28.1^\circ$
$\beta = 110.426 (12)^\circ$	$\mu = 2.54 \text{ mm}^{-1}$
$V = 1244.82 (19) \text{ \AA}^3$	$T = 170 (2) \text{ K}$
$Z = 4$	Block, colourless
	$0.14 \times 0.10 \times 0.07 \text{ mm}$

### Data collection

Stoe IPDSI diffractometer	2939 independent reflections
Radiation source: fine-focus sealed tube	2297 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.036$
$T = 170(2) \text{ K}$	$\theta_{\text{max}} = 28.1^\circ$
Phi scans	$\theta_{\text{min}} = 3.0^\circ$
Absorption correction: numerical (X-SHAPE; Stoe & Cie, 1998)	$h = -16 \rightarrow 15$
$T_{\text{min}} = 0.751, T_{\text{max}} = 0.852$	$k = -8 \rightarrow 10$
7272 measured reflections	$l = -15 \rightarrow 18$

### Refinement

Refinement on $F^2$	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.036$	$w = 1/[\sigma^2(F_o^2) + (0.0636P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$wR(F^2) = 0.096$	$(\Delta/\sigma)_{\text{max}} < 0.001$
$S = 1.00$	$\Delta\rho_{\text{max}} = 0.47 \text{ e \AA}^{-3}$
2939 reflections	$\Delta\rho_{\text{min}} = -0.60 \text{ e \AA}^{-3}$
146 parameters	Extinction correction: SHELXL, $F_c^* = kF_c[1 + 0.001xF_c^2\lambda^3/\sin(2\theta)]^{1/4}$

Primary atom site location: structure-invariant direct methods Extinction coefficient: 0.0121 (14)

Secondary atom site location: difference Fourier map

### *Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
